

How much marsh restoration is enough to deliver coastal protection benefits?

Herring River Estuary, Wellfleet, MA

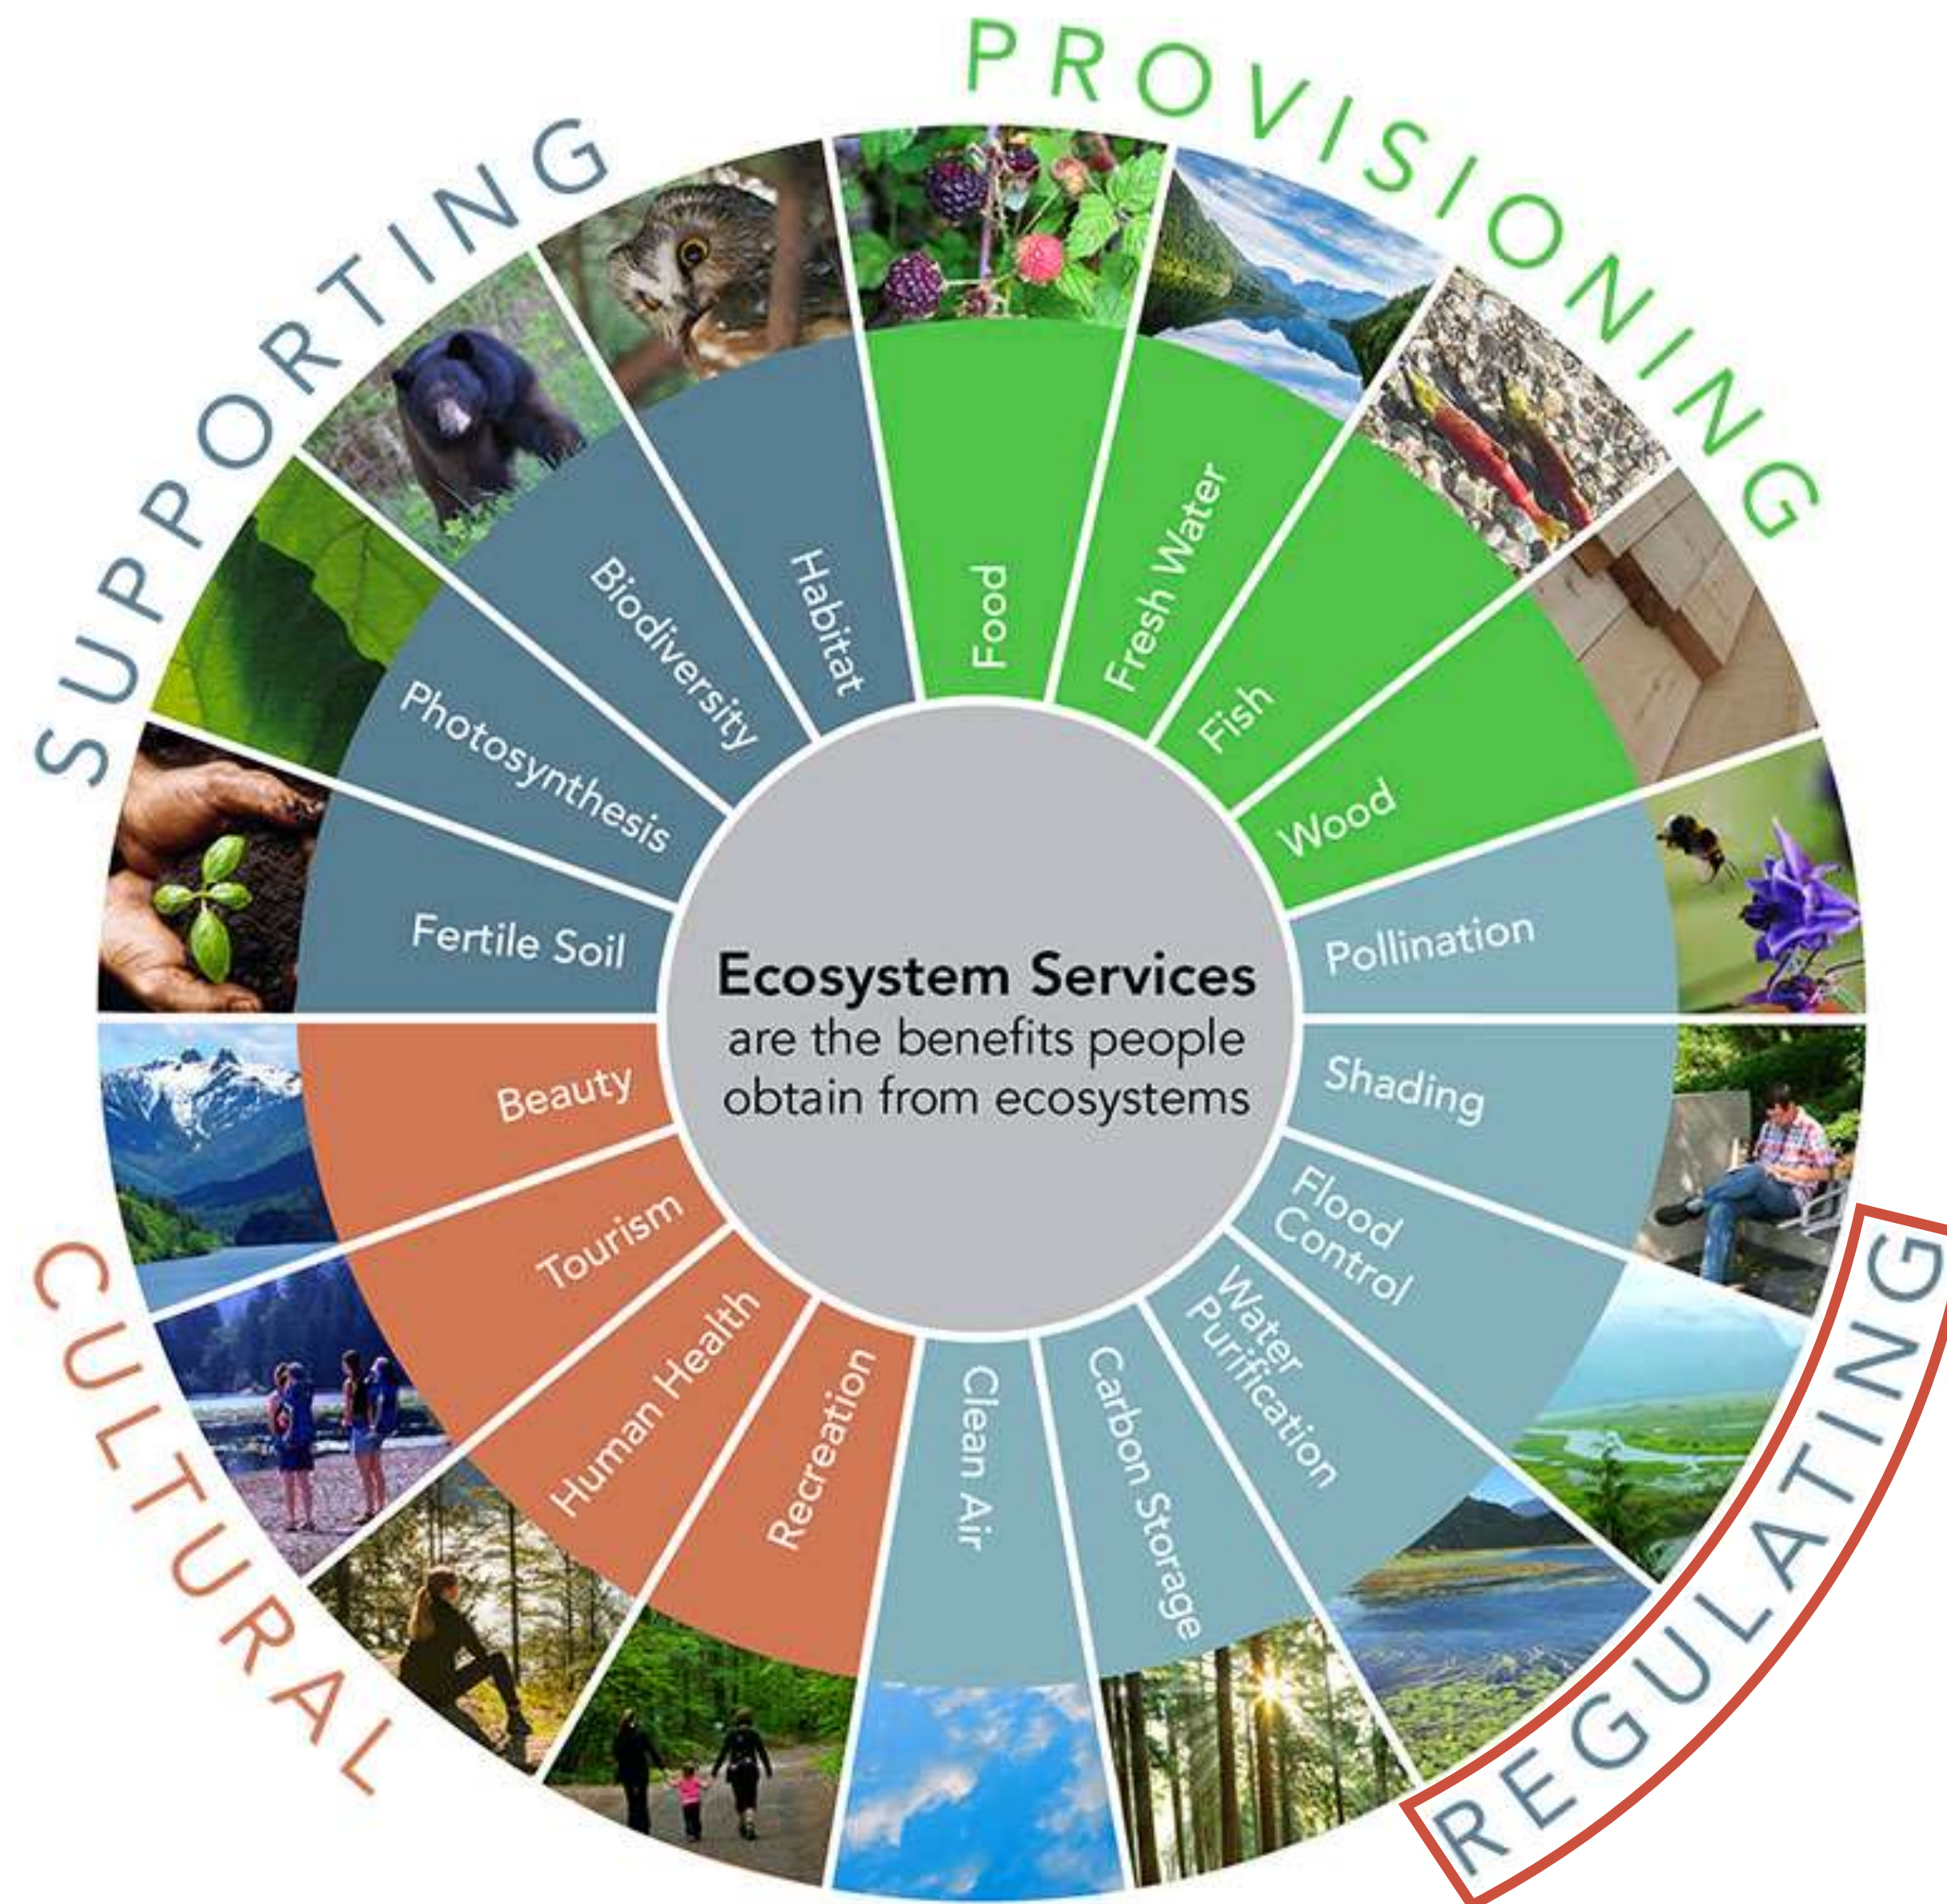

Katherine A. Castagno, Ph.D.
Martha's Vineyard Coastal Conference
24 October 2022

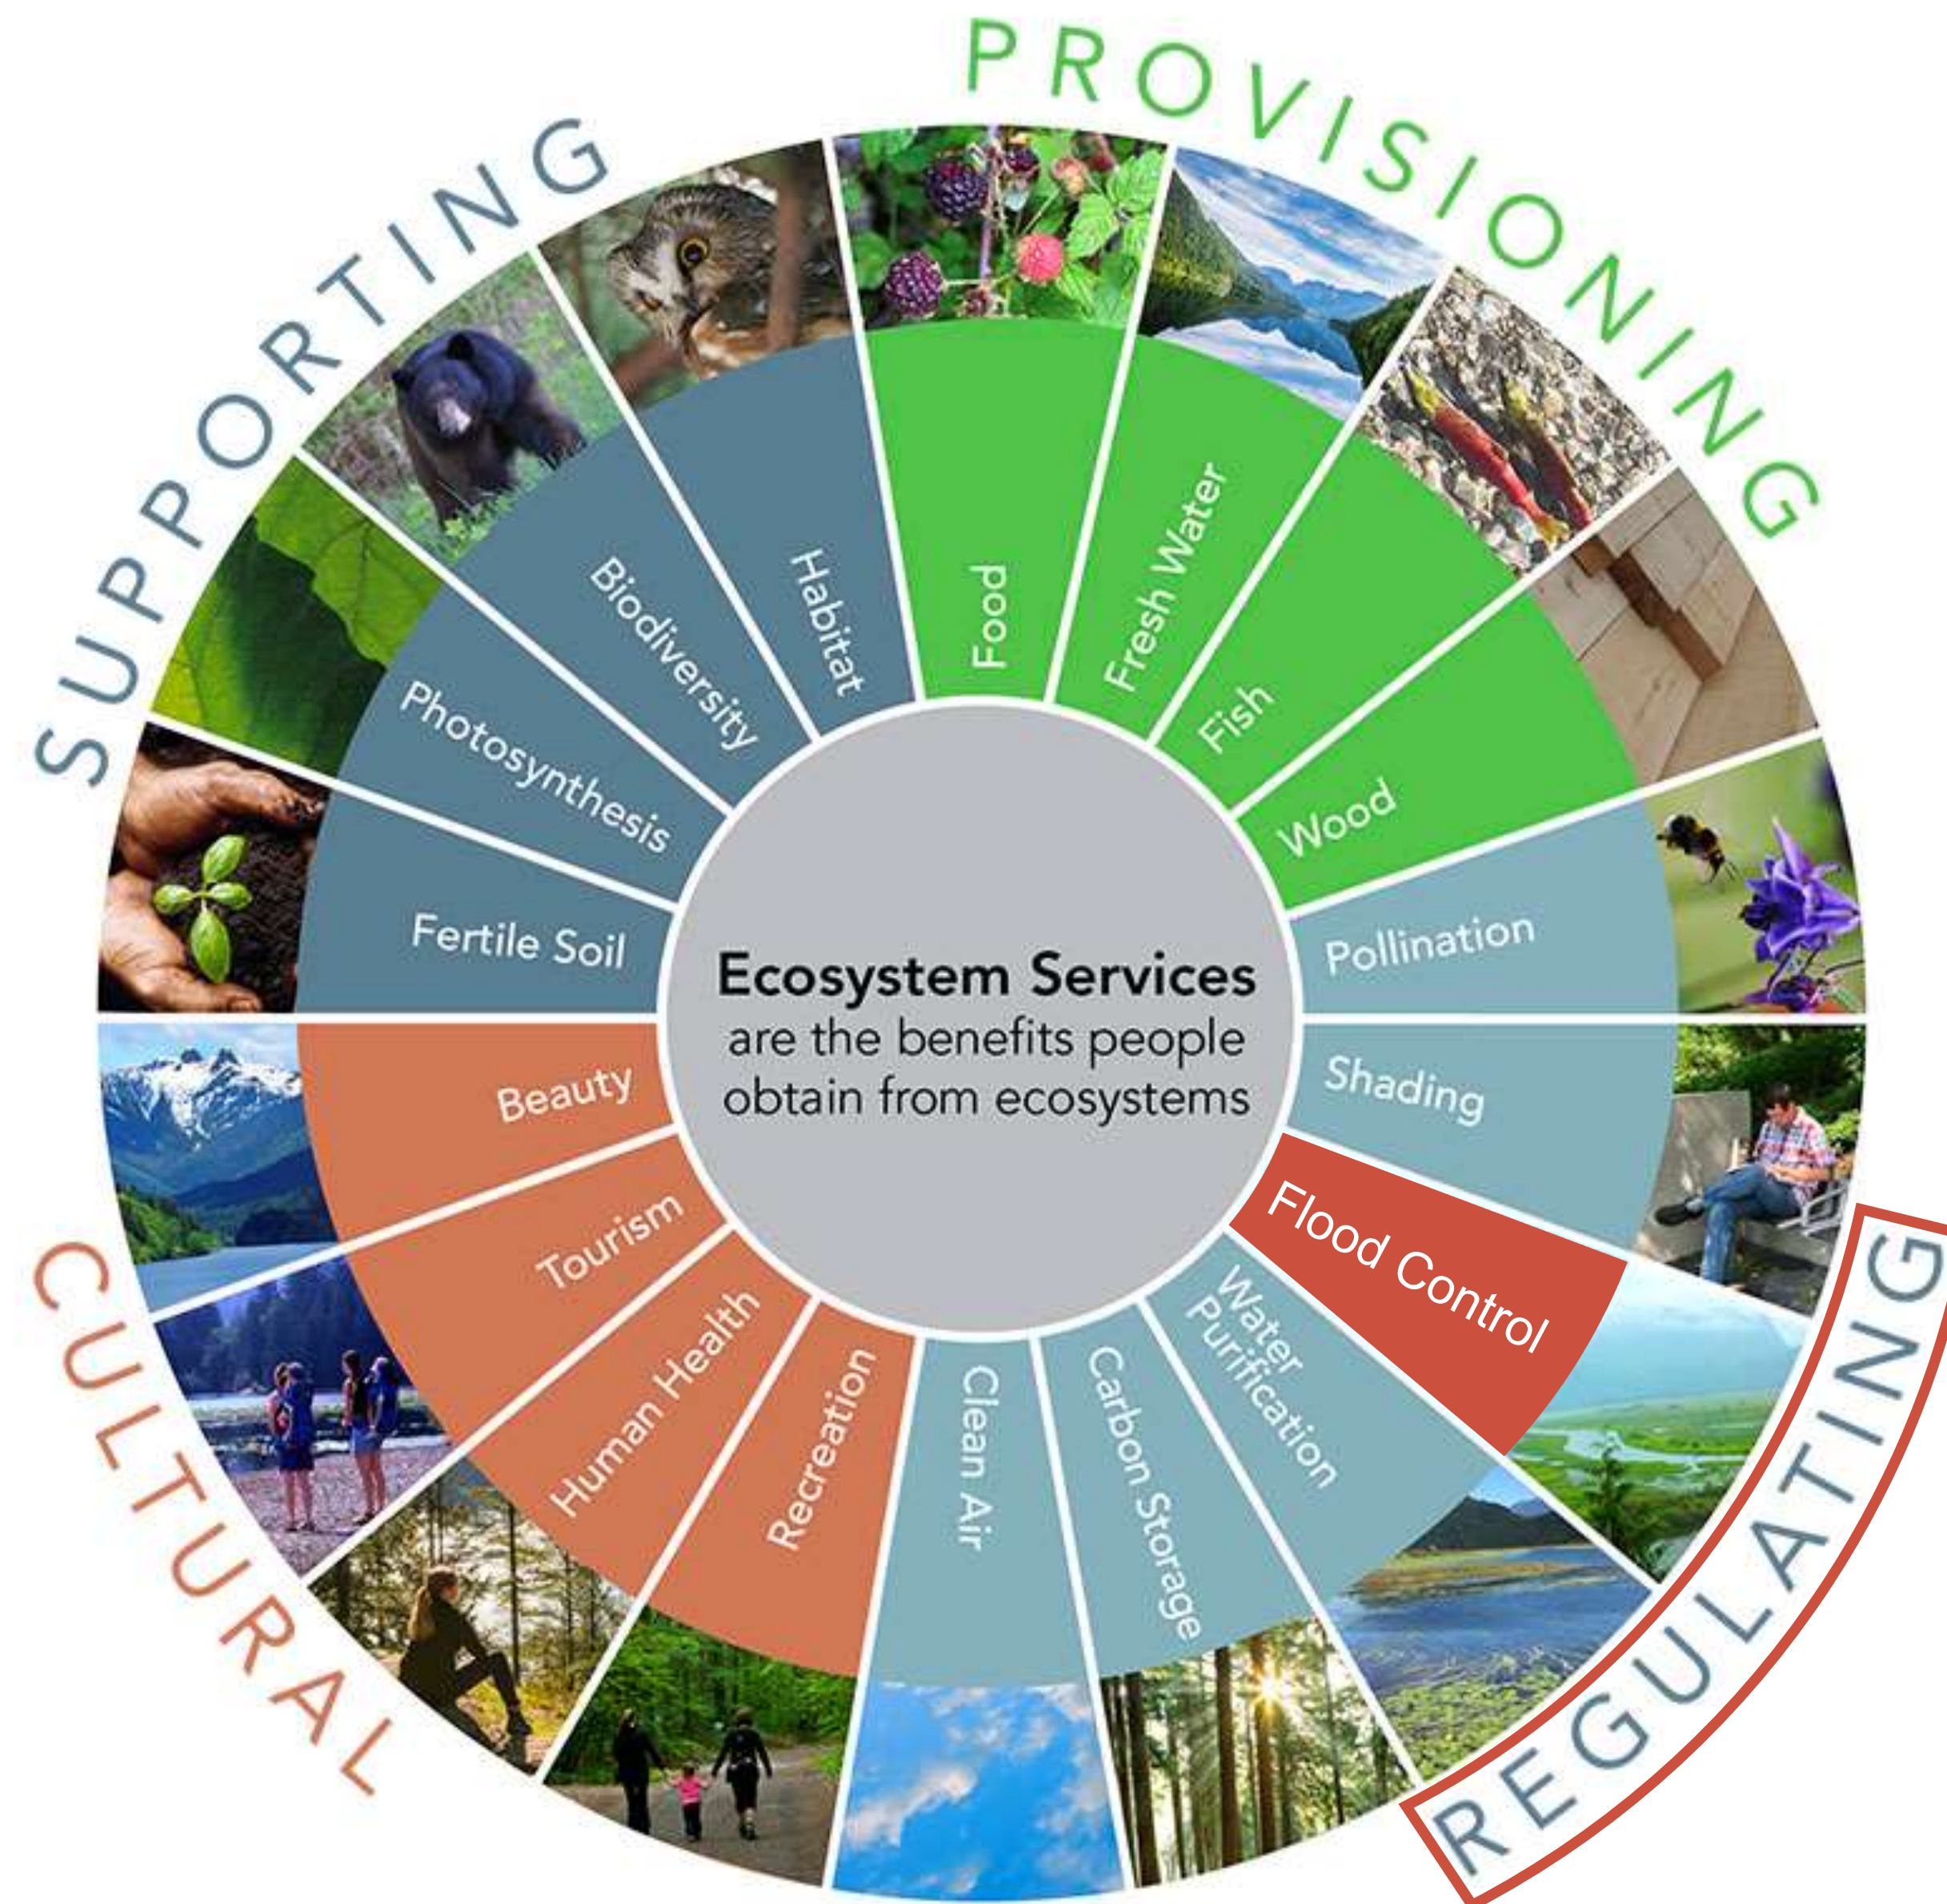

Salt marshes provide valuable ecosystem services

Salt marshes provide valuable ecosystem services

Salt marshes provide valuable ecosystem services

Salt marshes have experienced centuries of *natural* alteration

Sopkin *et al.* (2014)

Fagherazzi *et al.* (2014)

Argow *et al.* (2011)

Salt marshes have experienced centuries of *human* alteration

DIKING AND DRAINING THE NEW JERSEY MEADOWS.

Scientific American (1868)

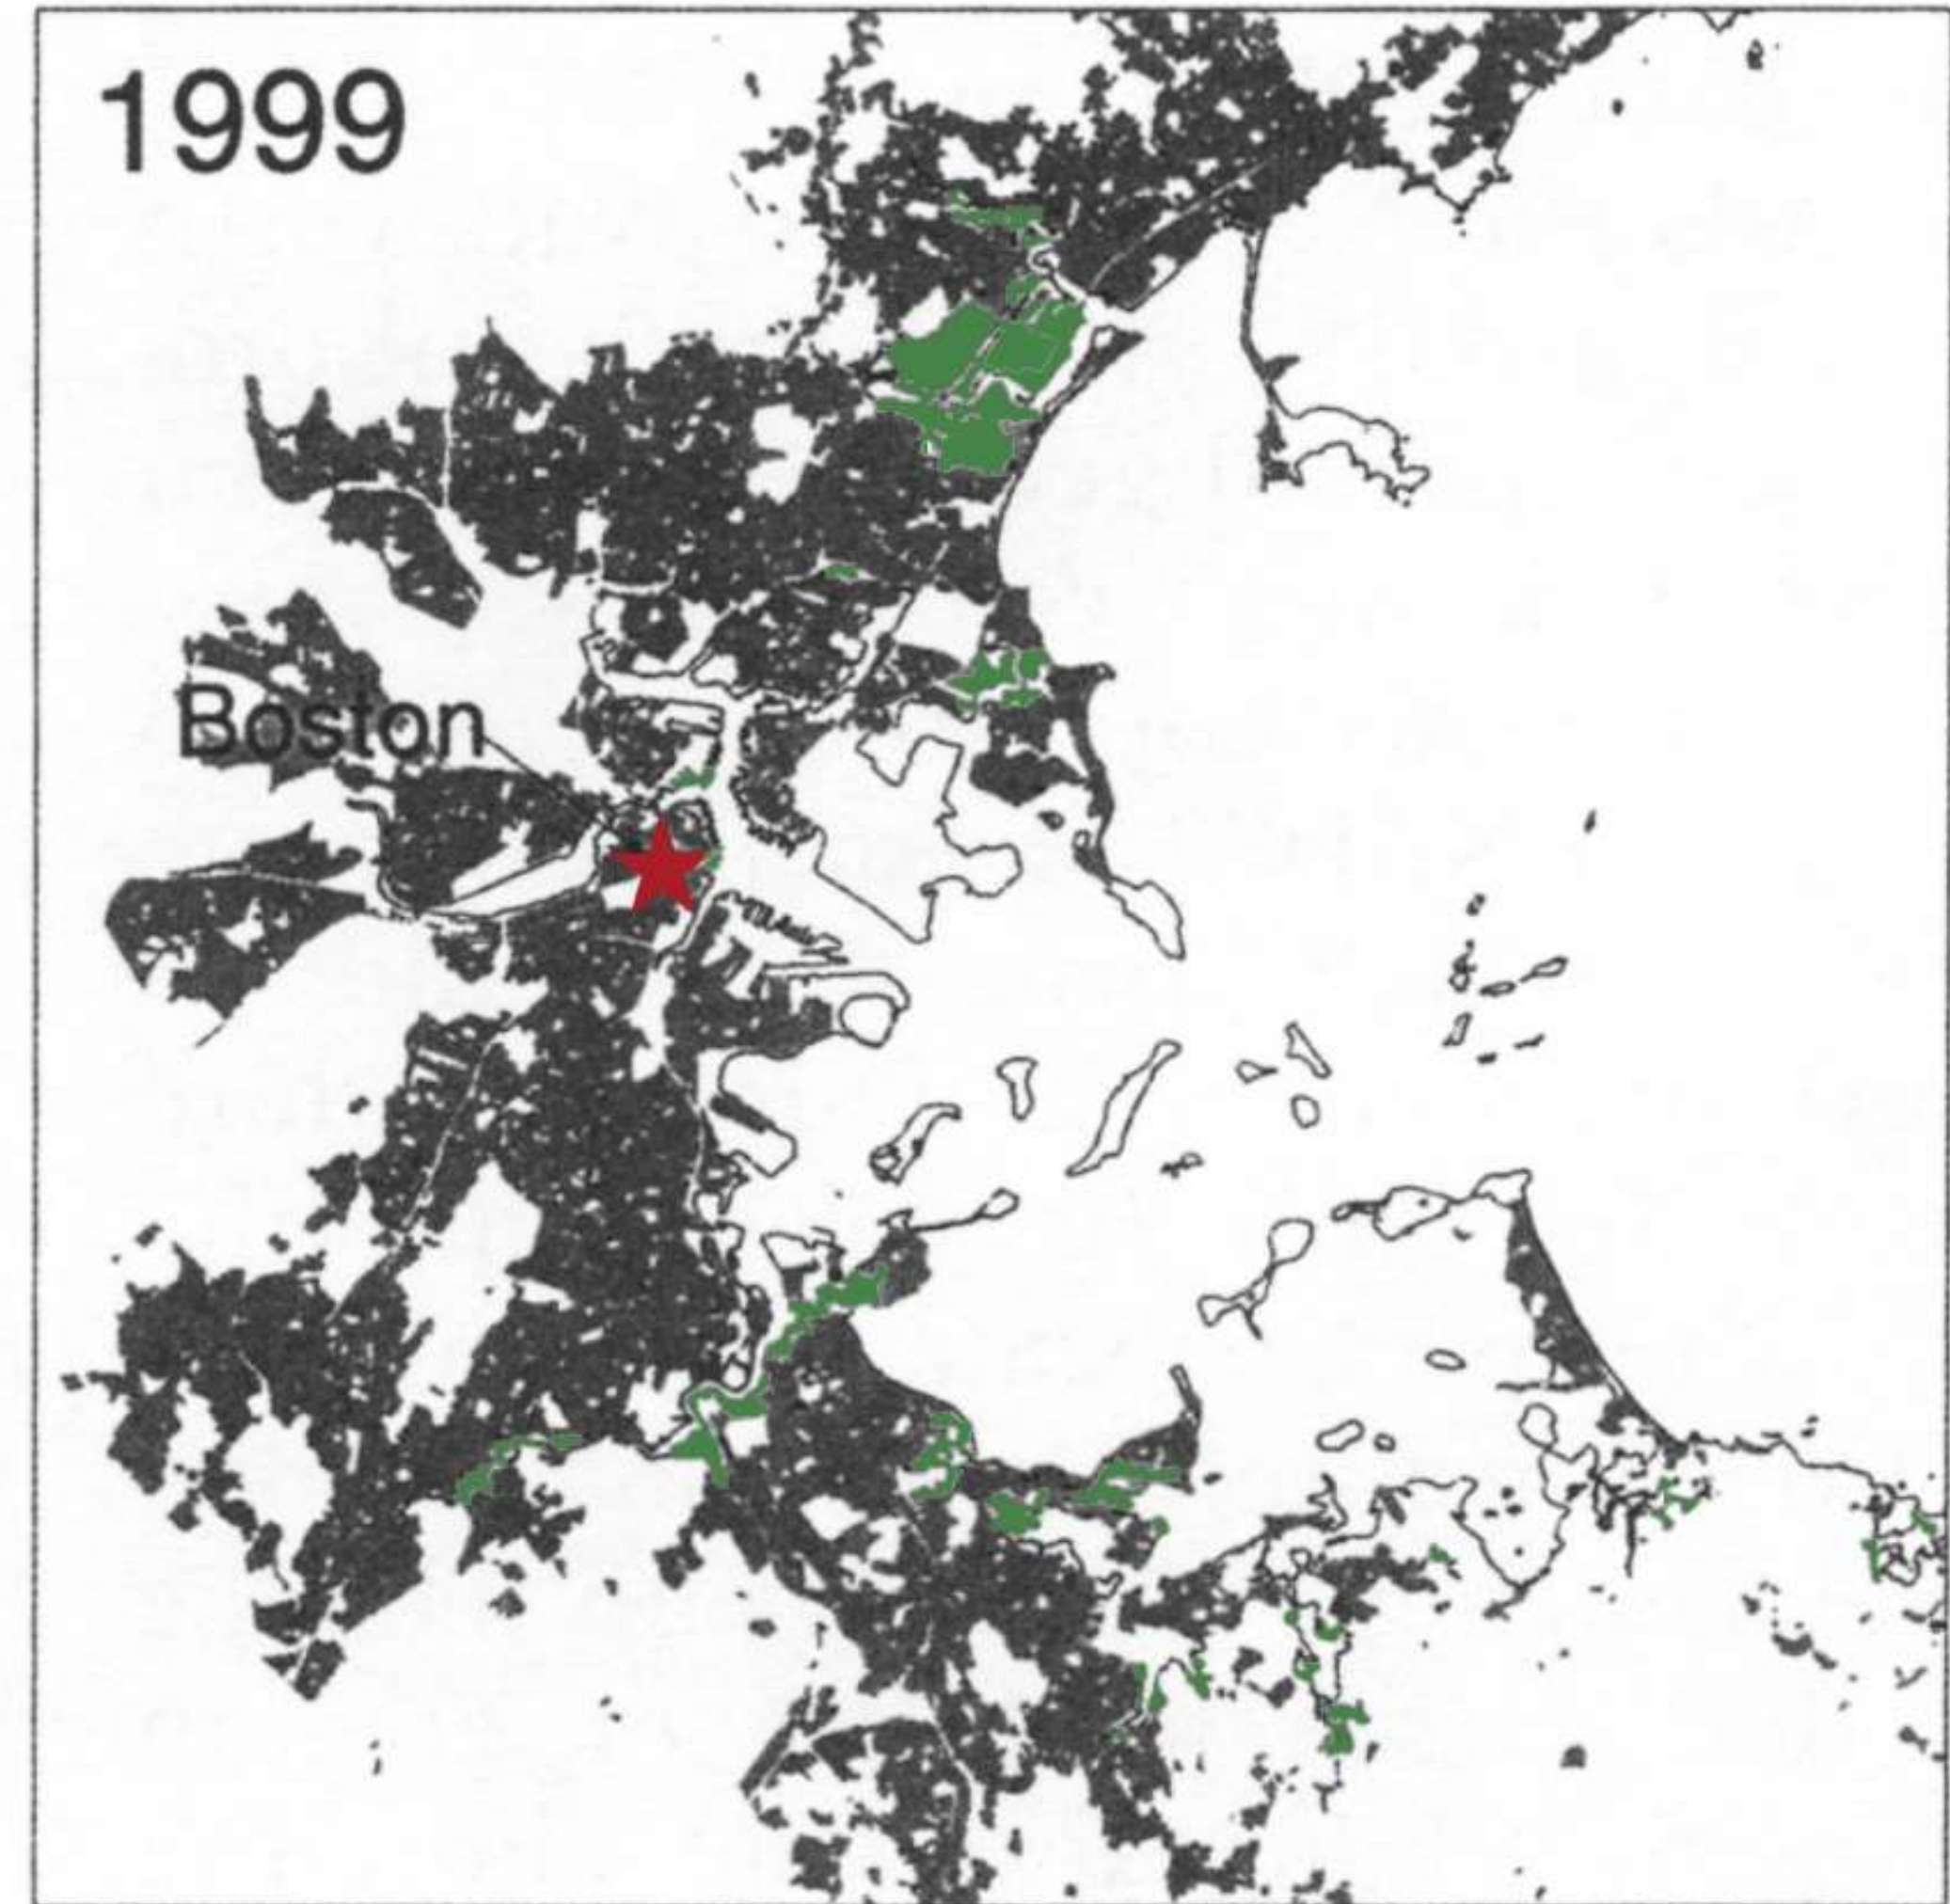

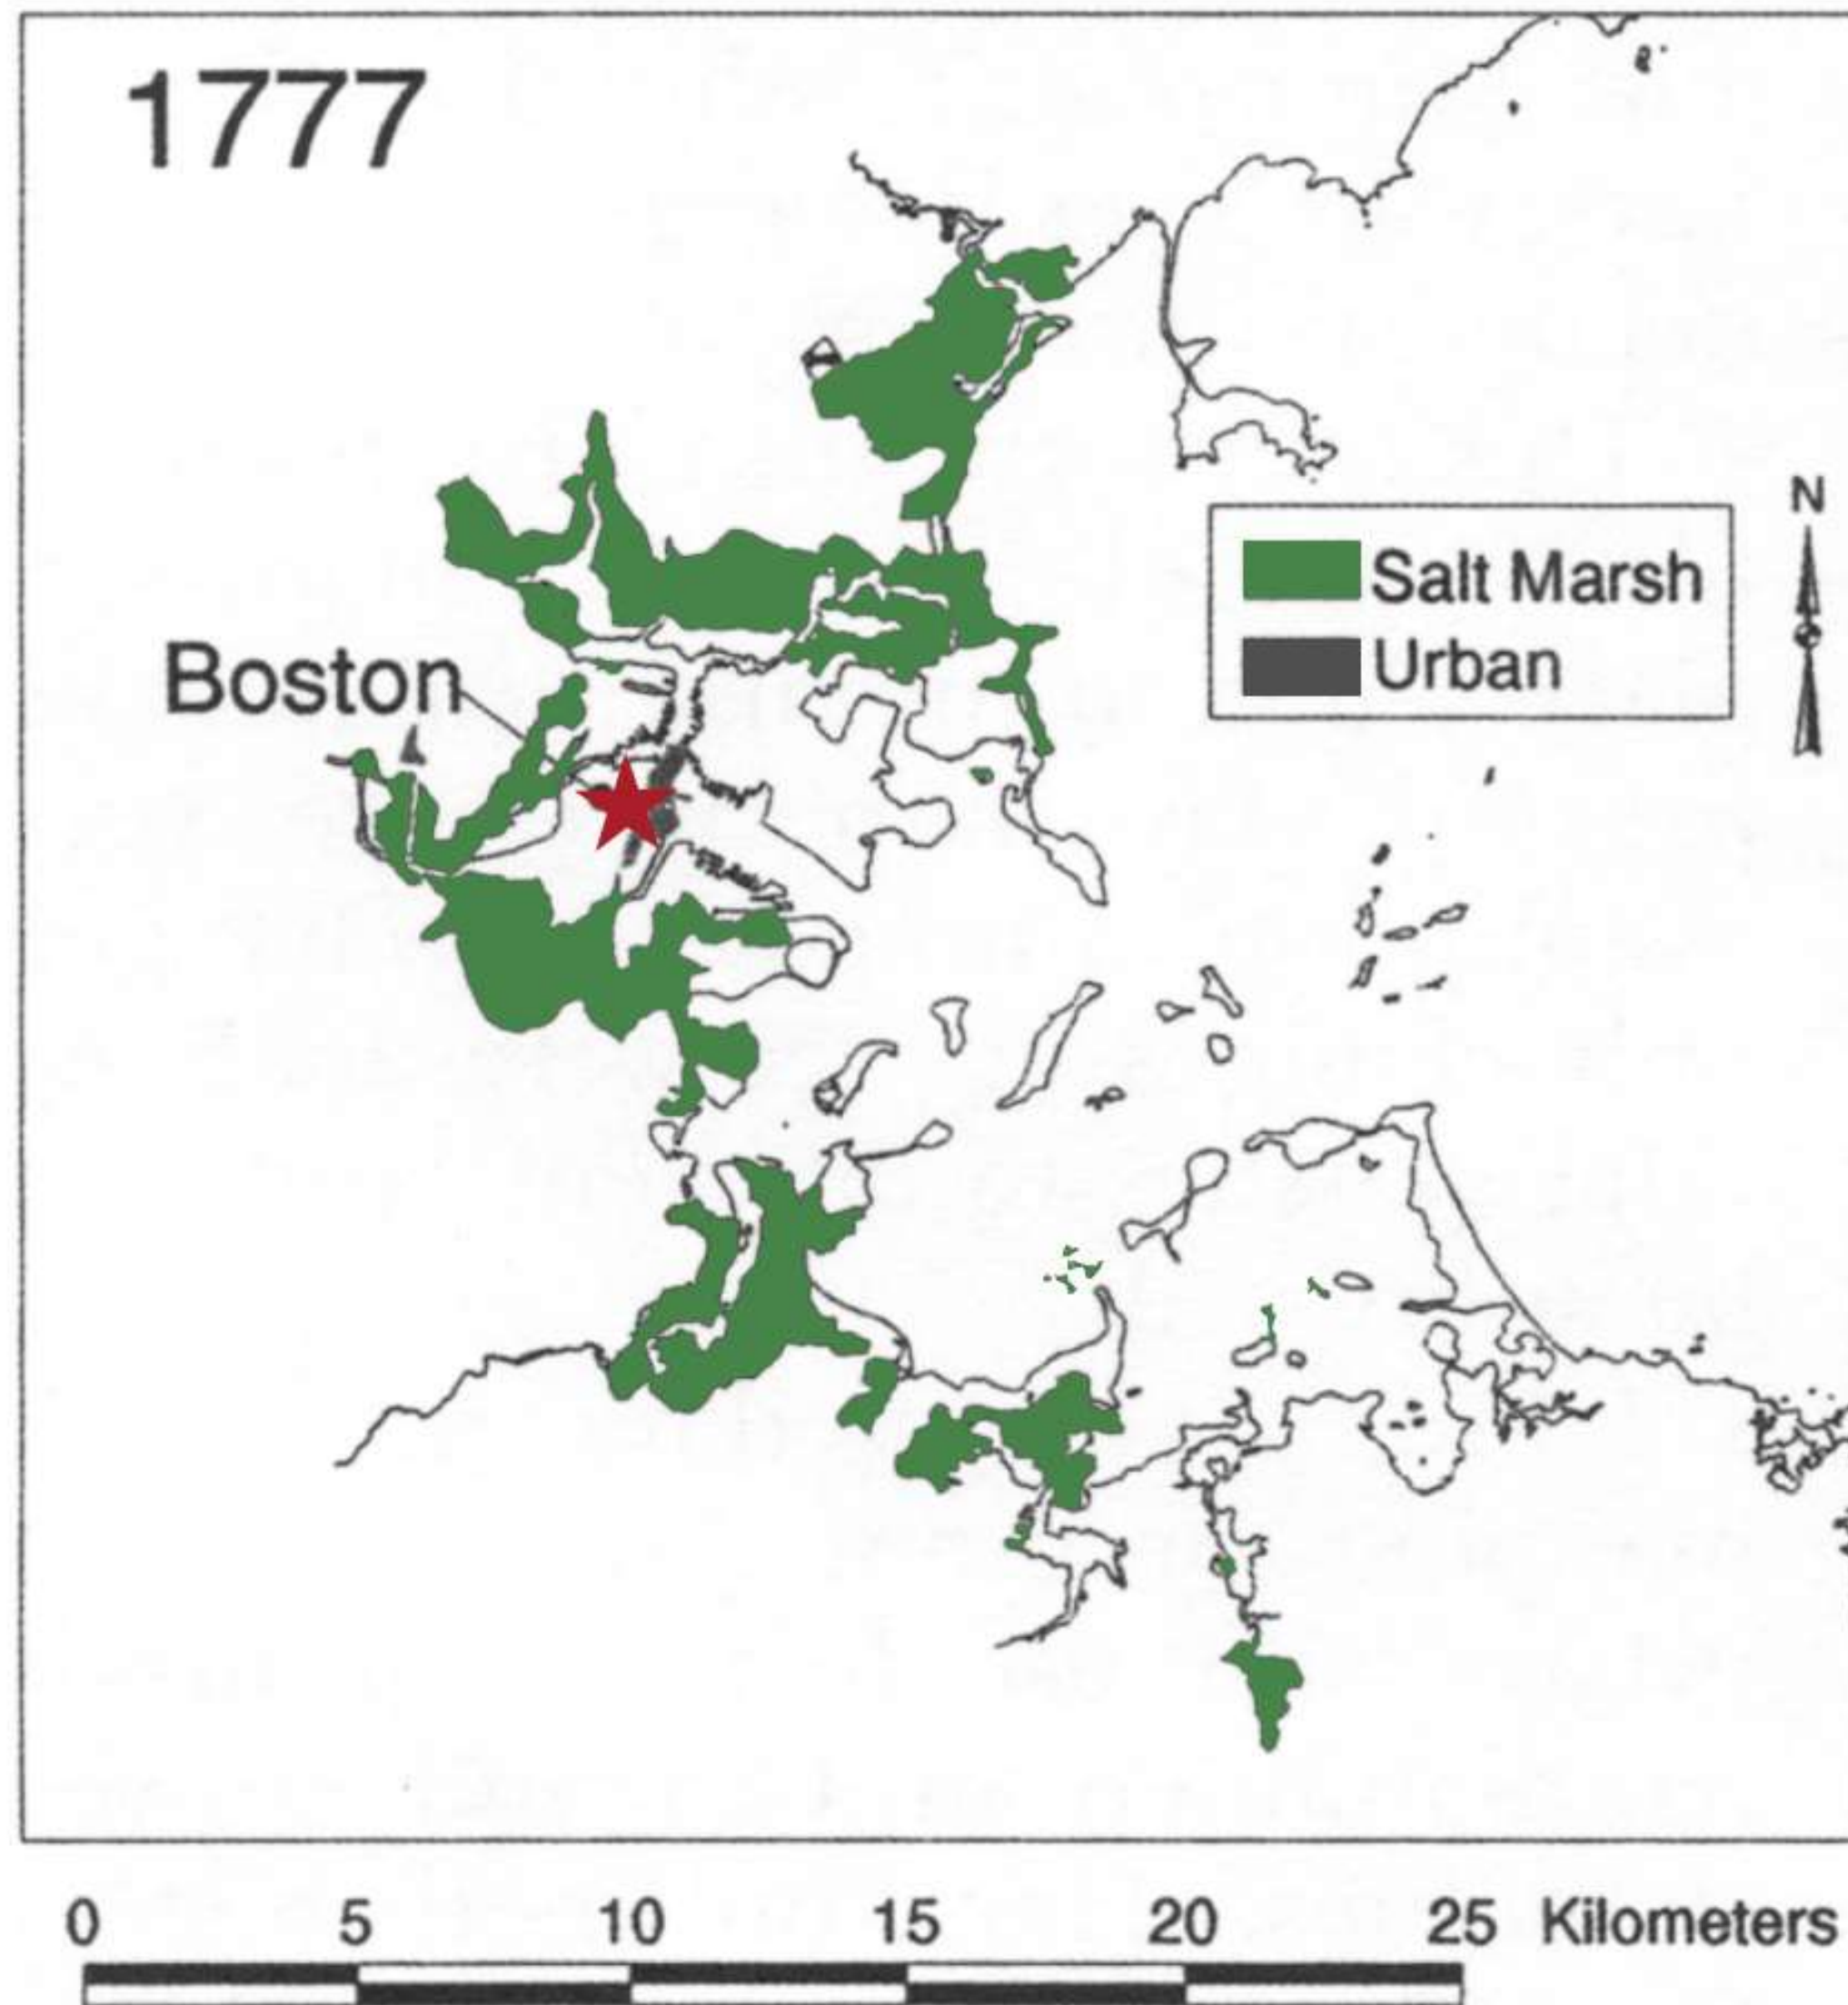

DE Mosquito Control Section (~1930)

George Dexter (~1900)

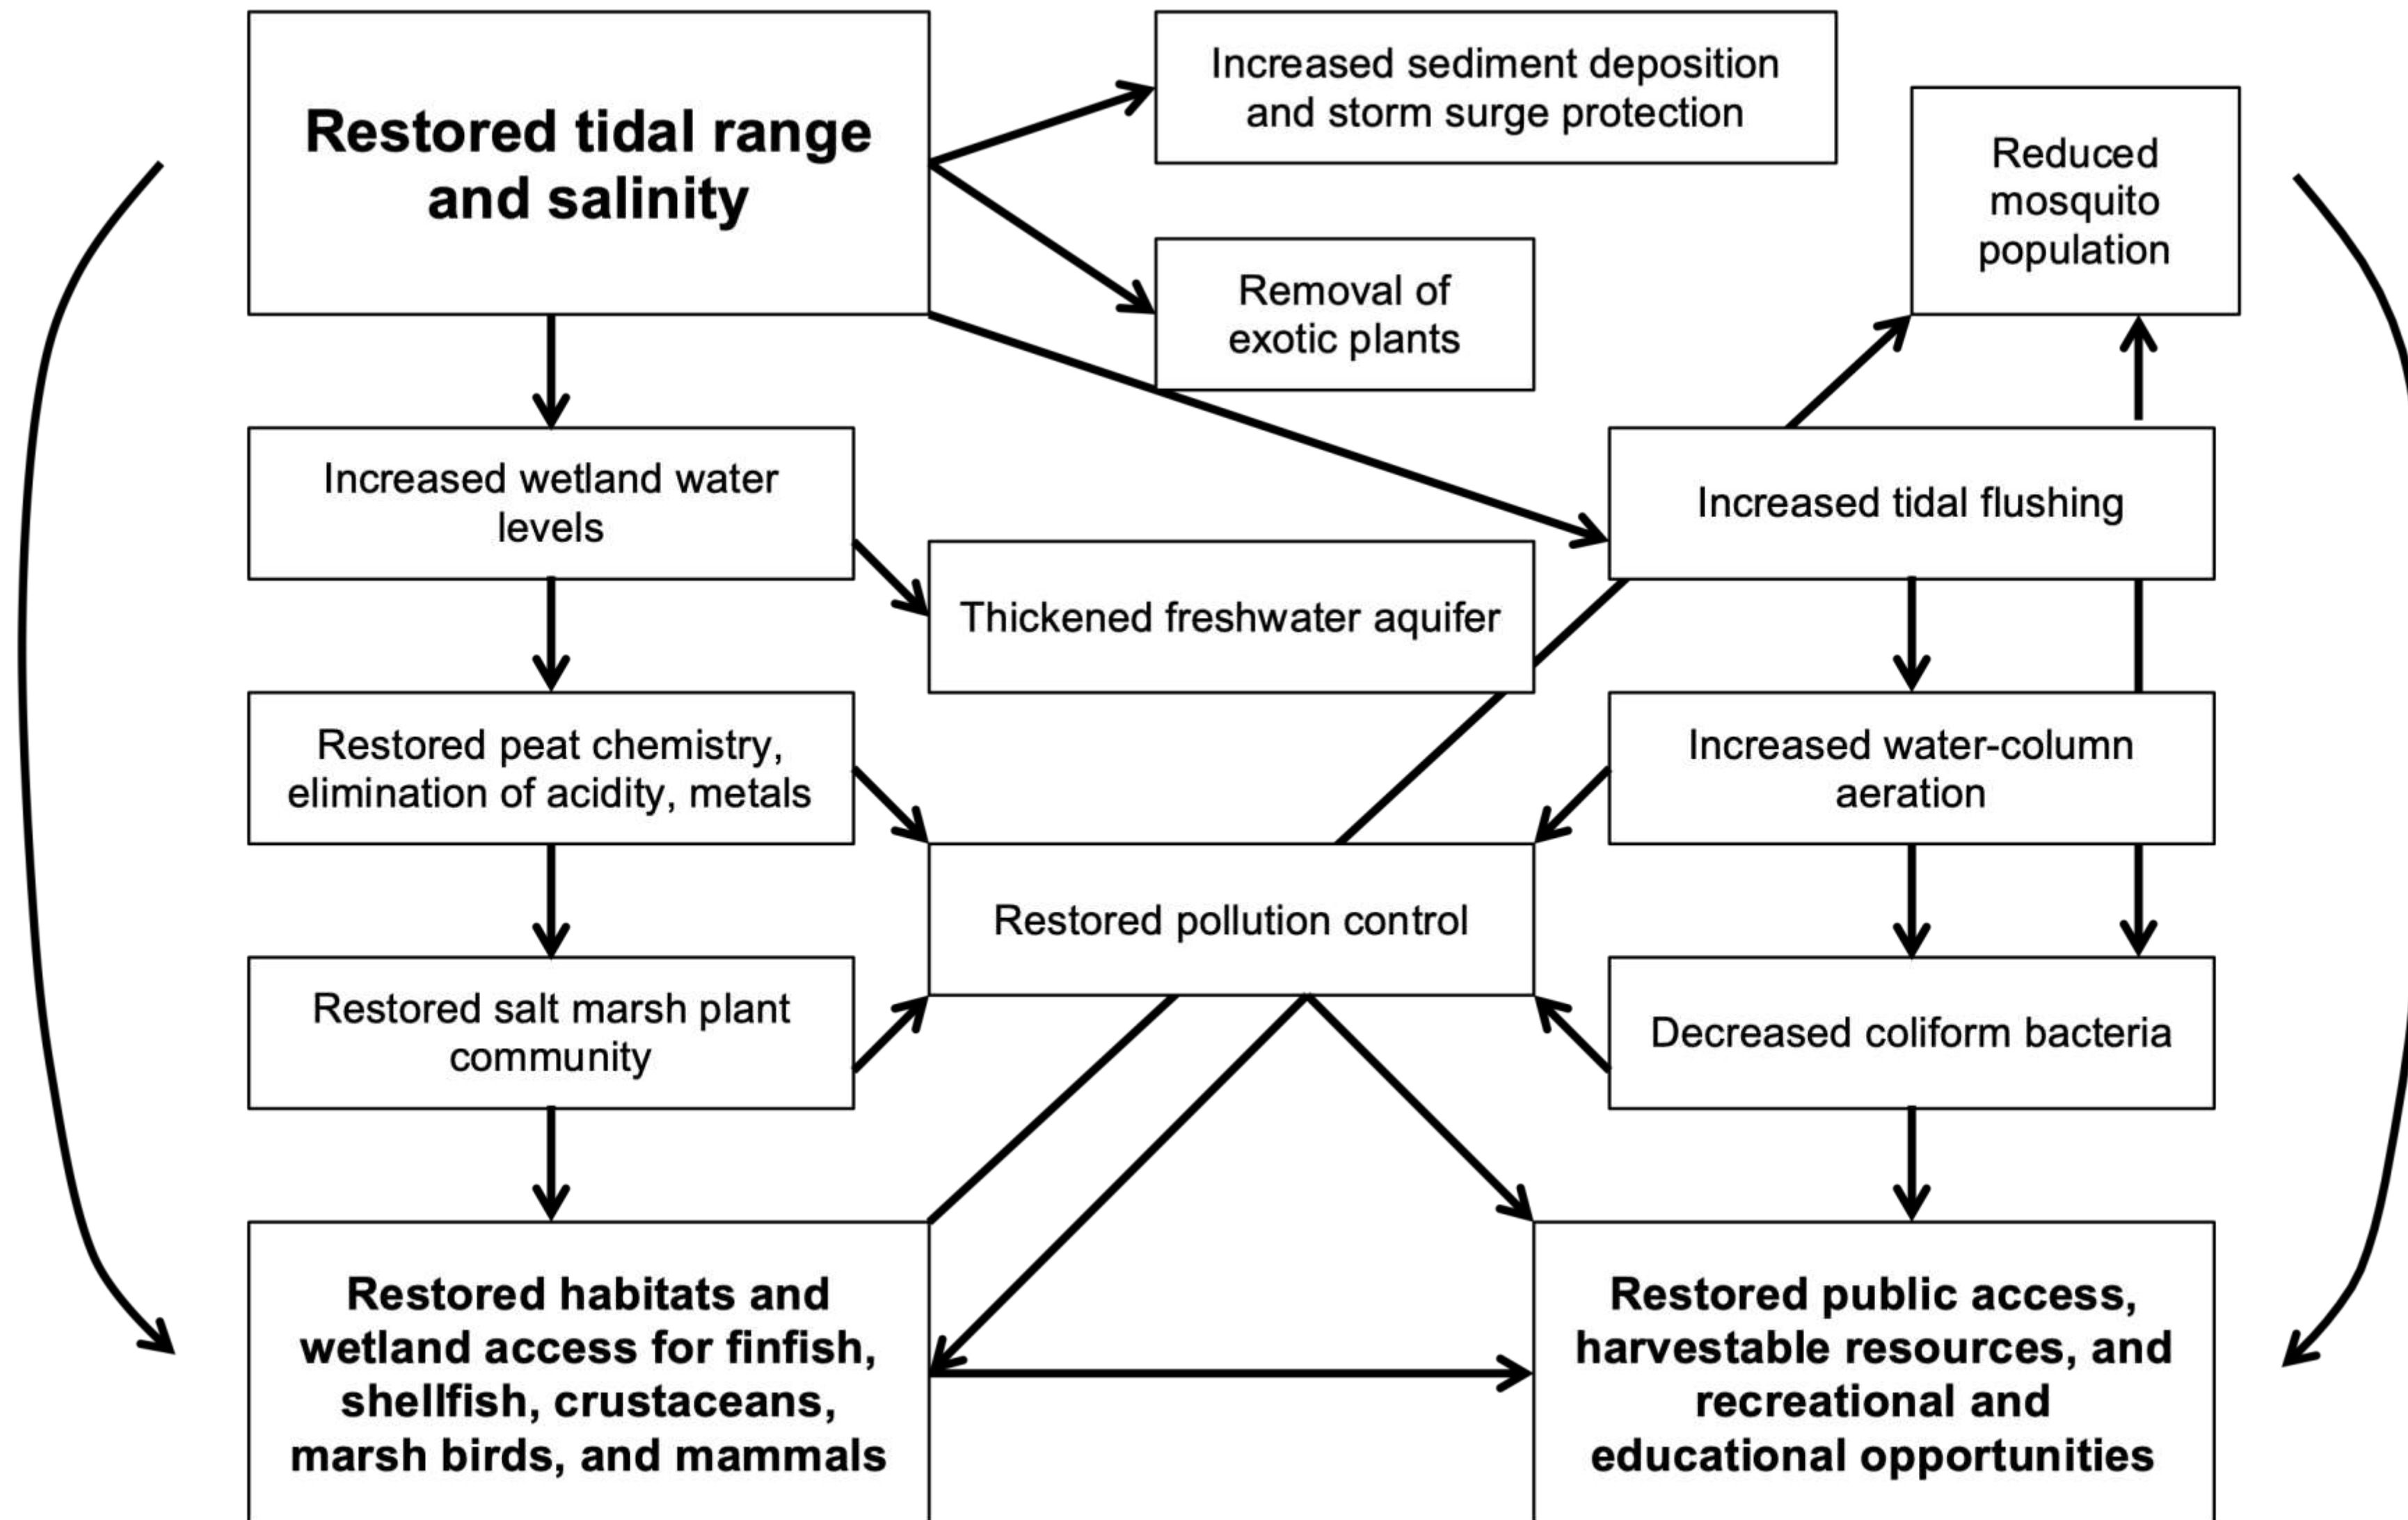

Marshes have been lost at an alarming rate

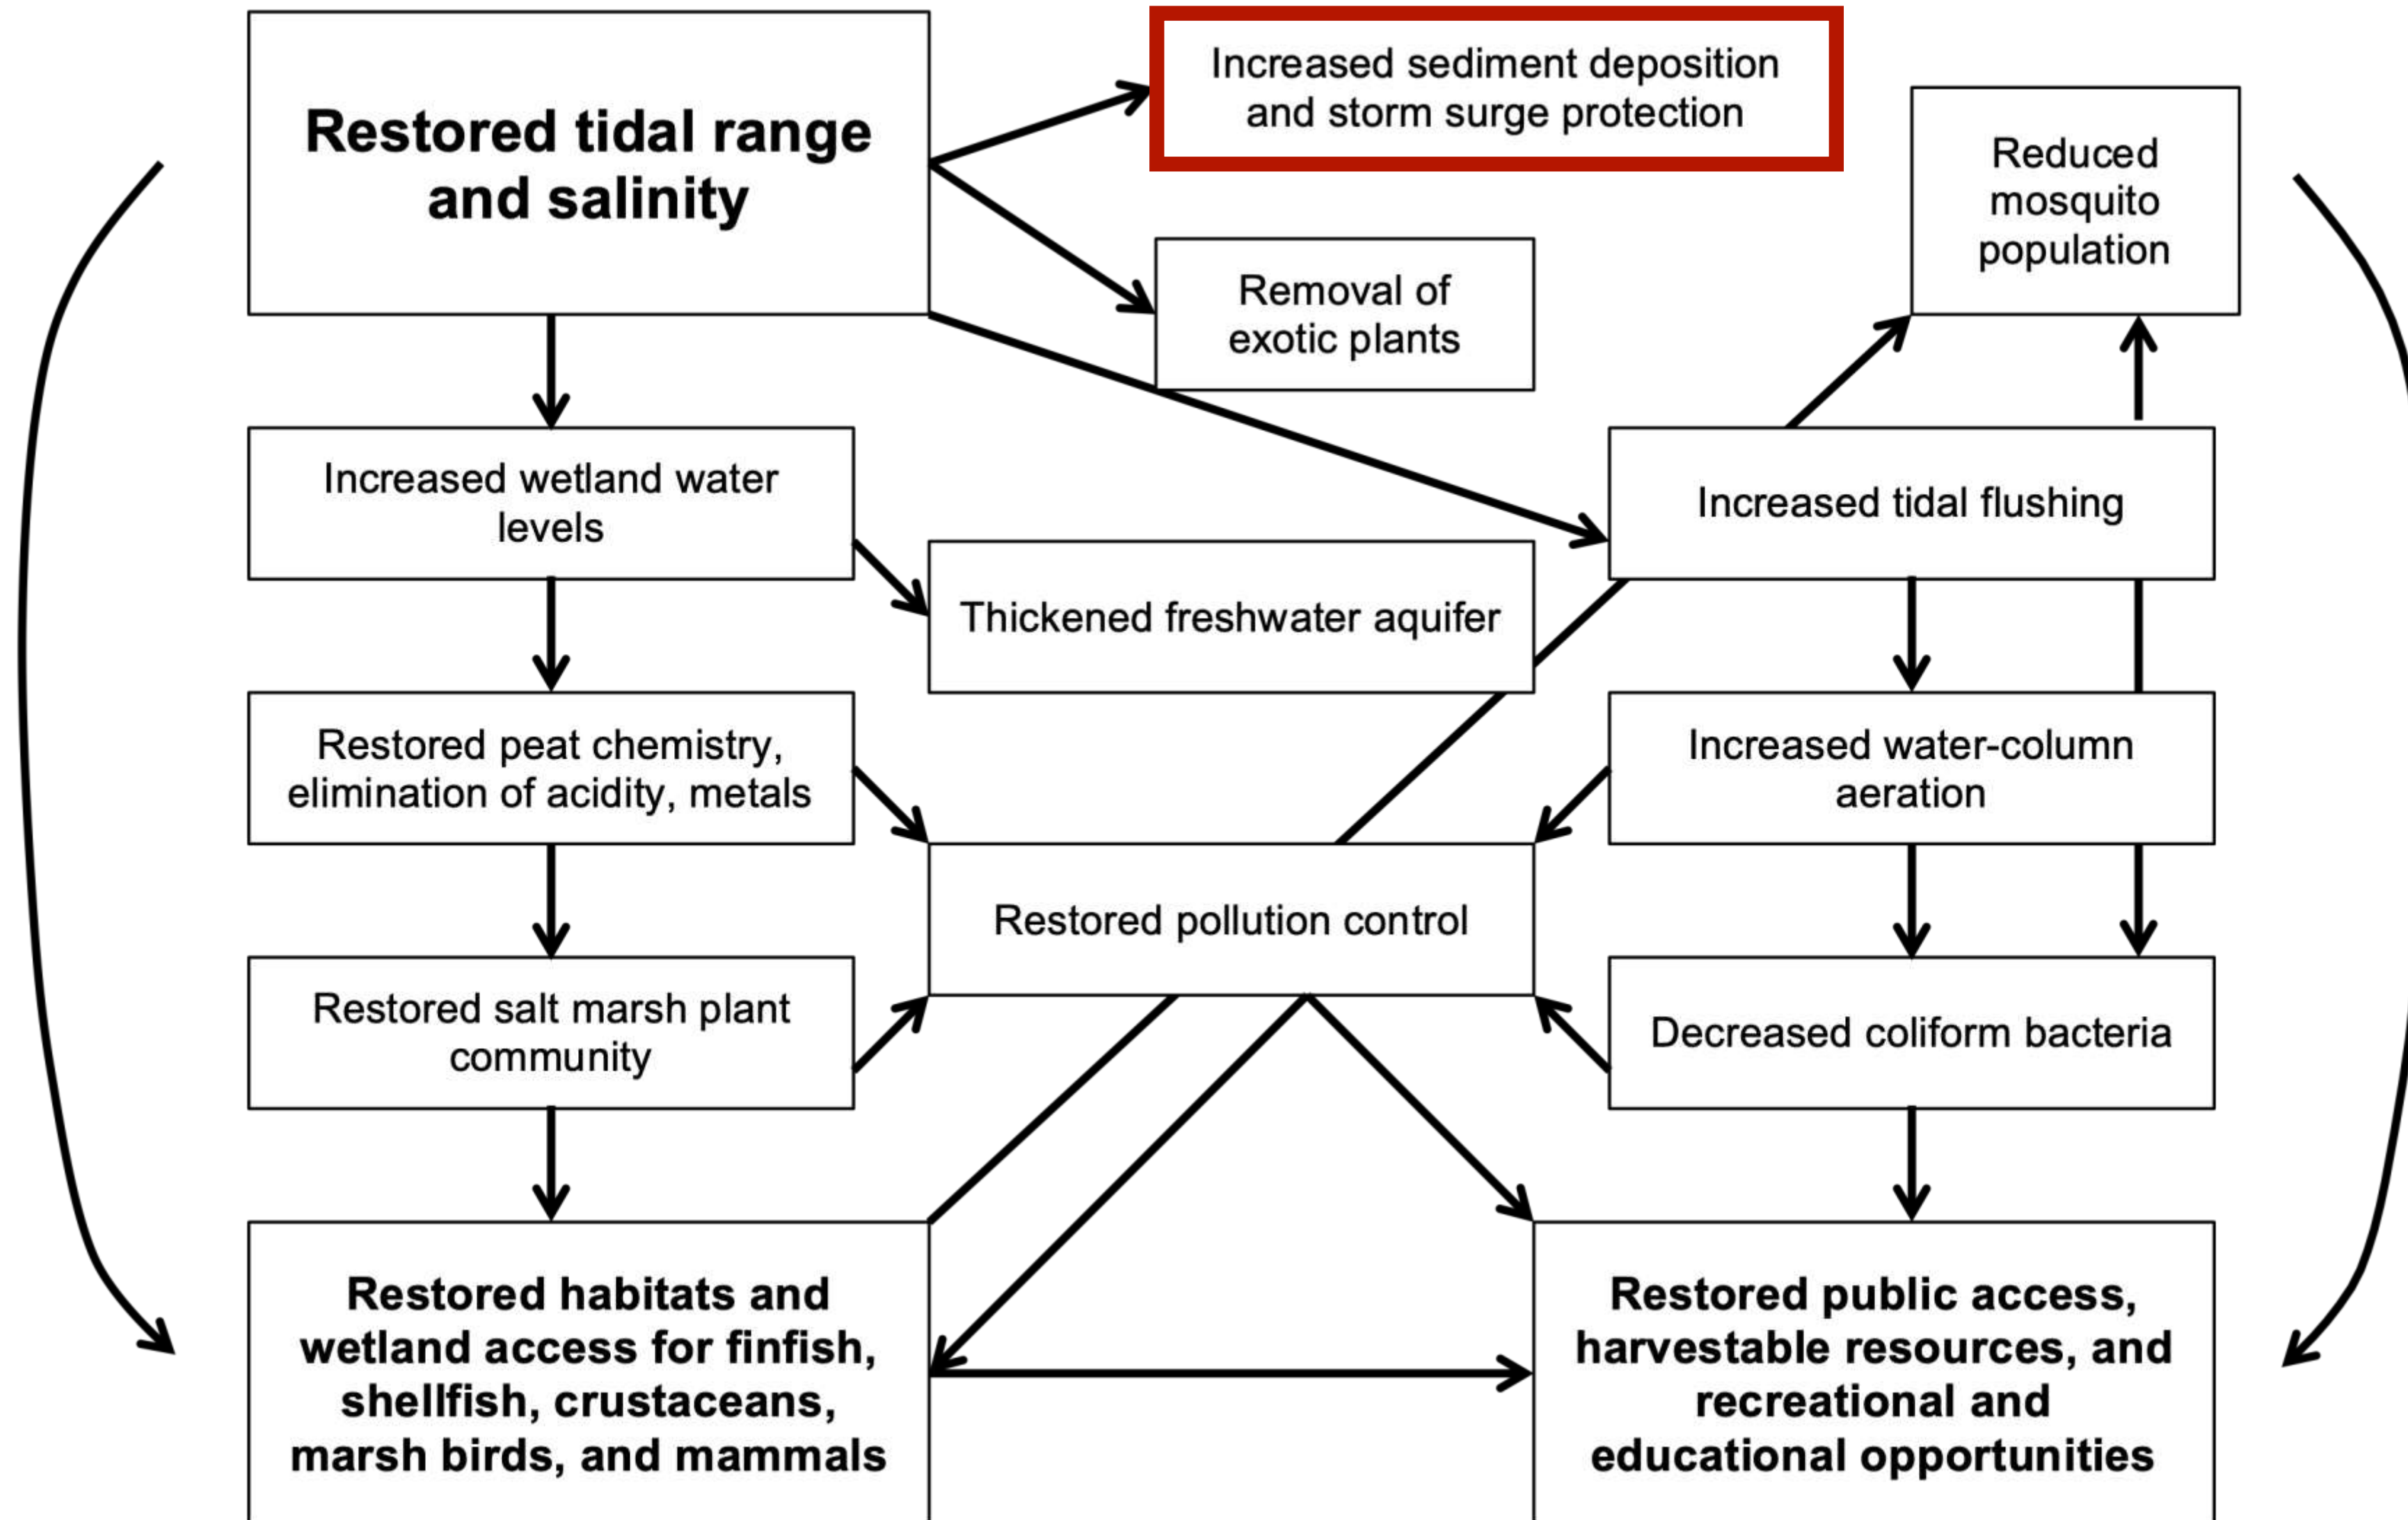

Bromberg and Bertness (2005)

Salt marsh restoration seeks to restore ecosystem services

Salt marsh restoration seeks to restore ecosystem services

Coastal communities are growing more vulnerable to storm impacts

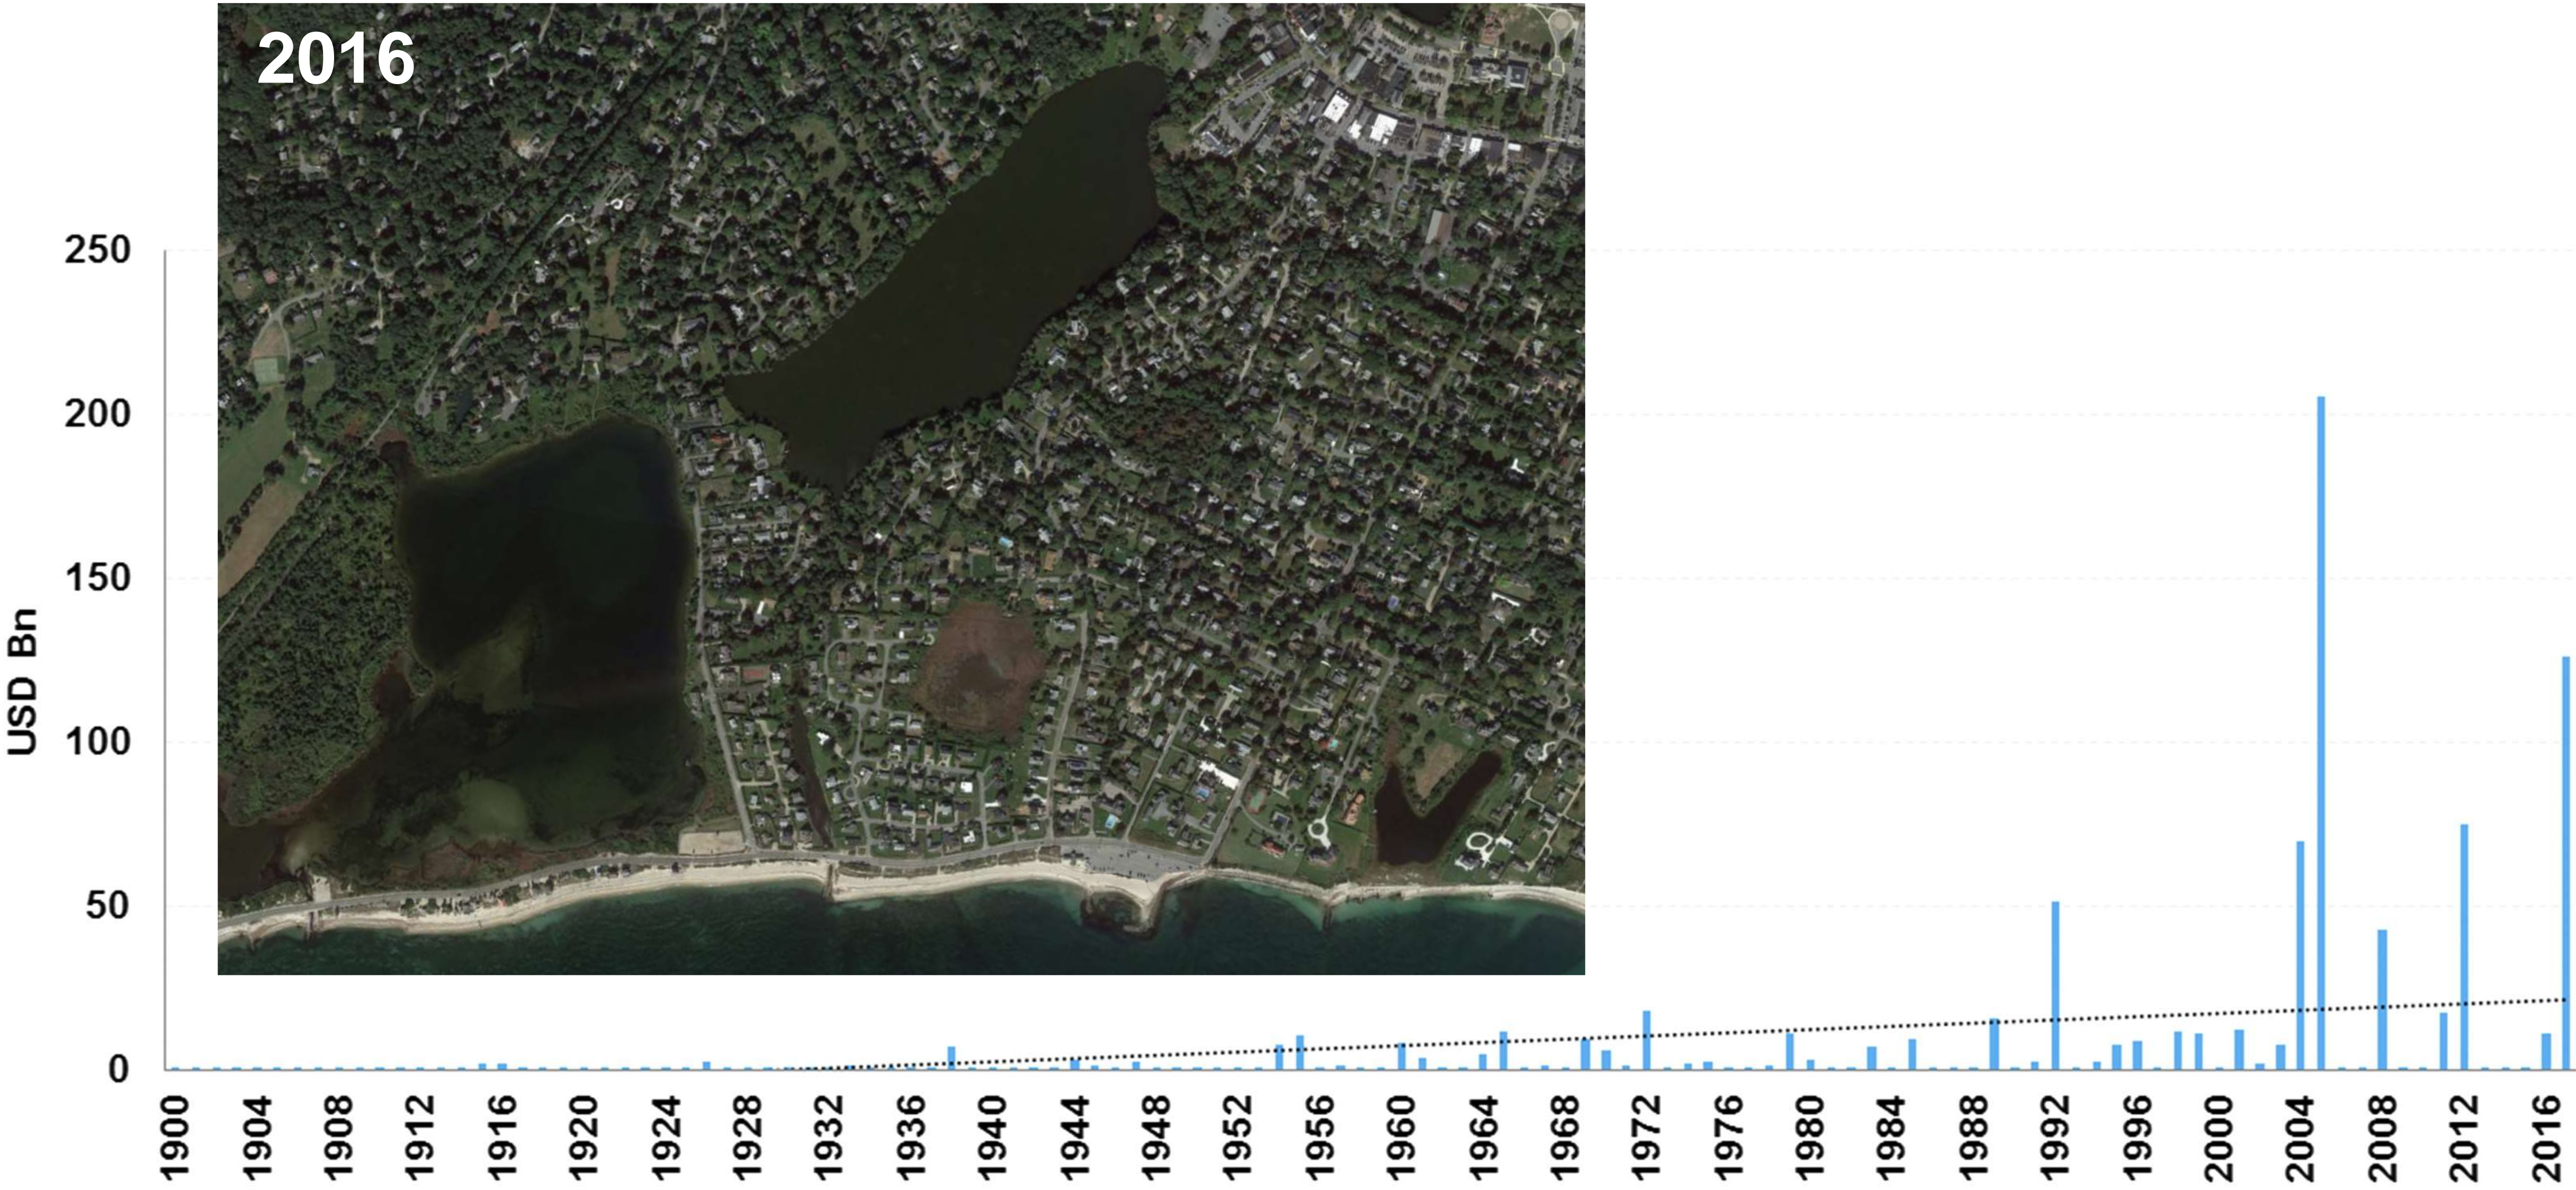

Coastal communities are growing more vulnerable to storm impacts

Wealth is concentrated along vulnerable coastlines

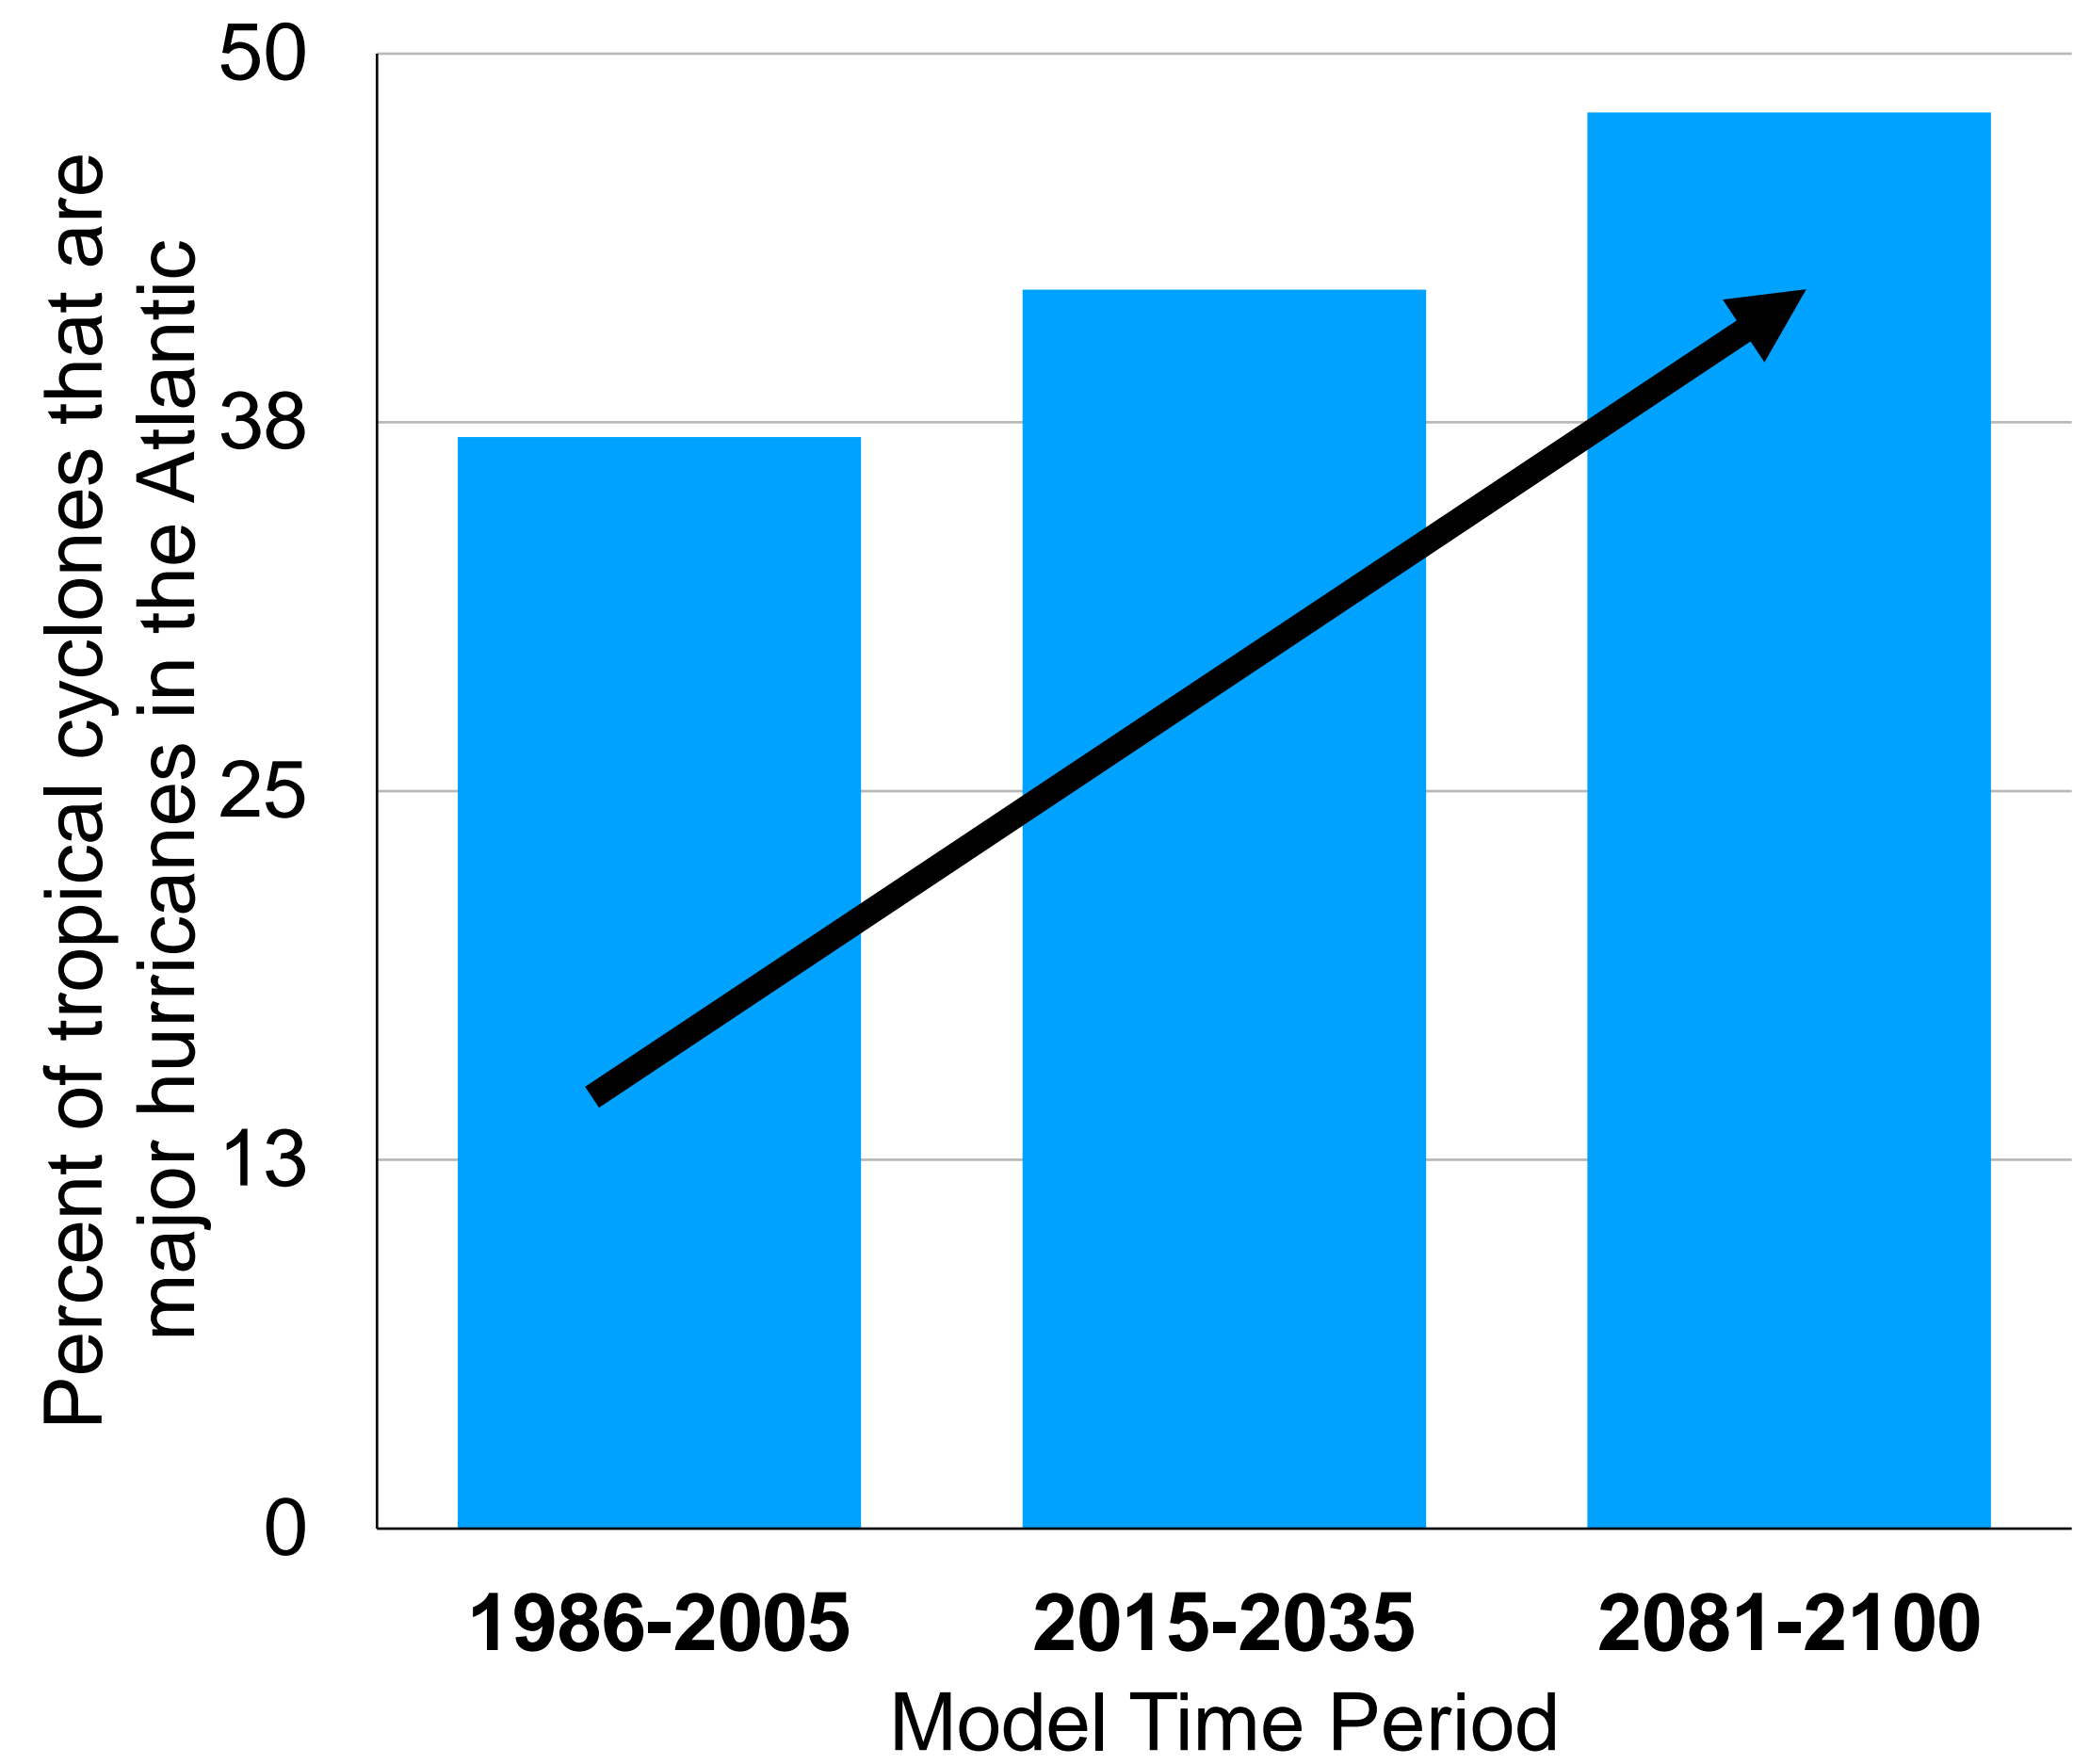

Wealth is concentrated along vulnerable coastlines

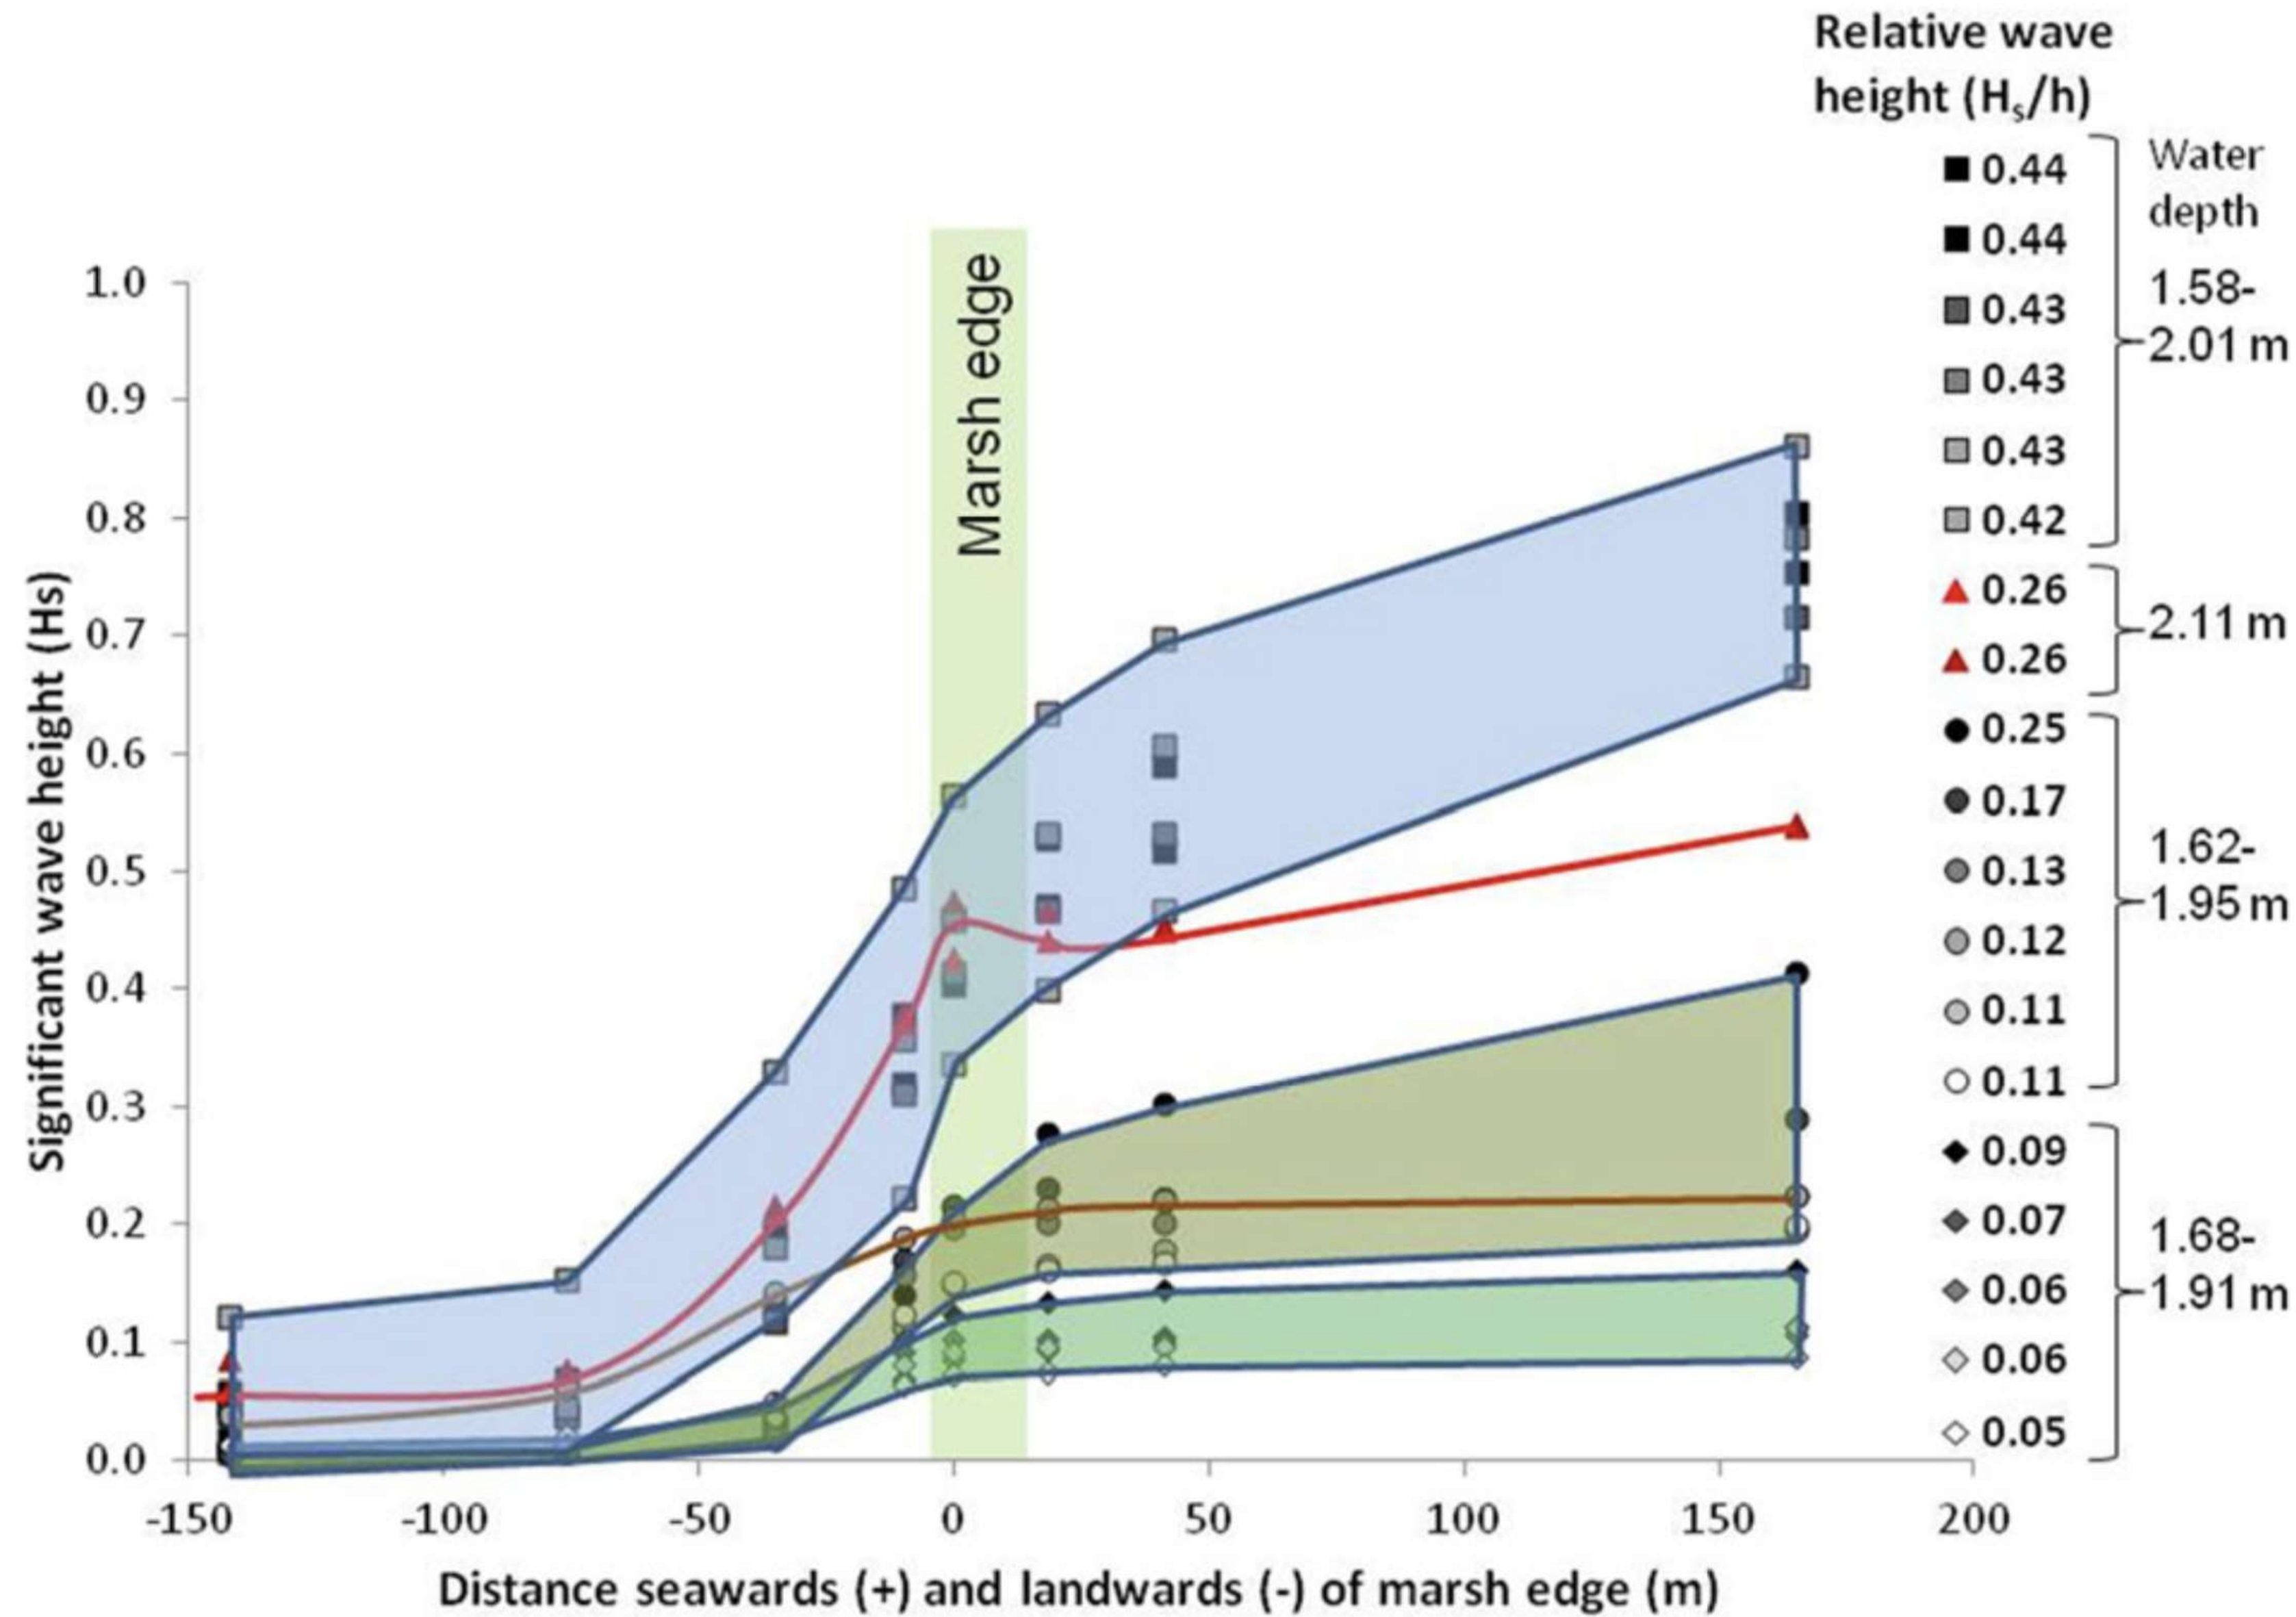

Intense hurricanes are estimated to increase in frequency

Intense hurricanes are estimated to increase in frequency

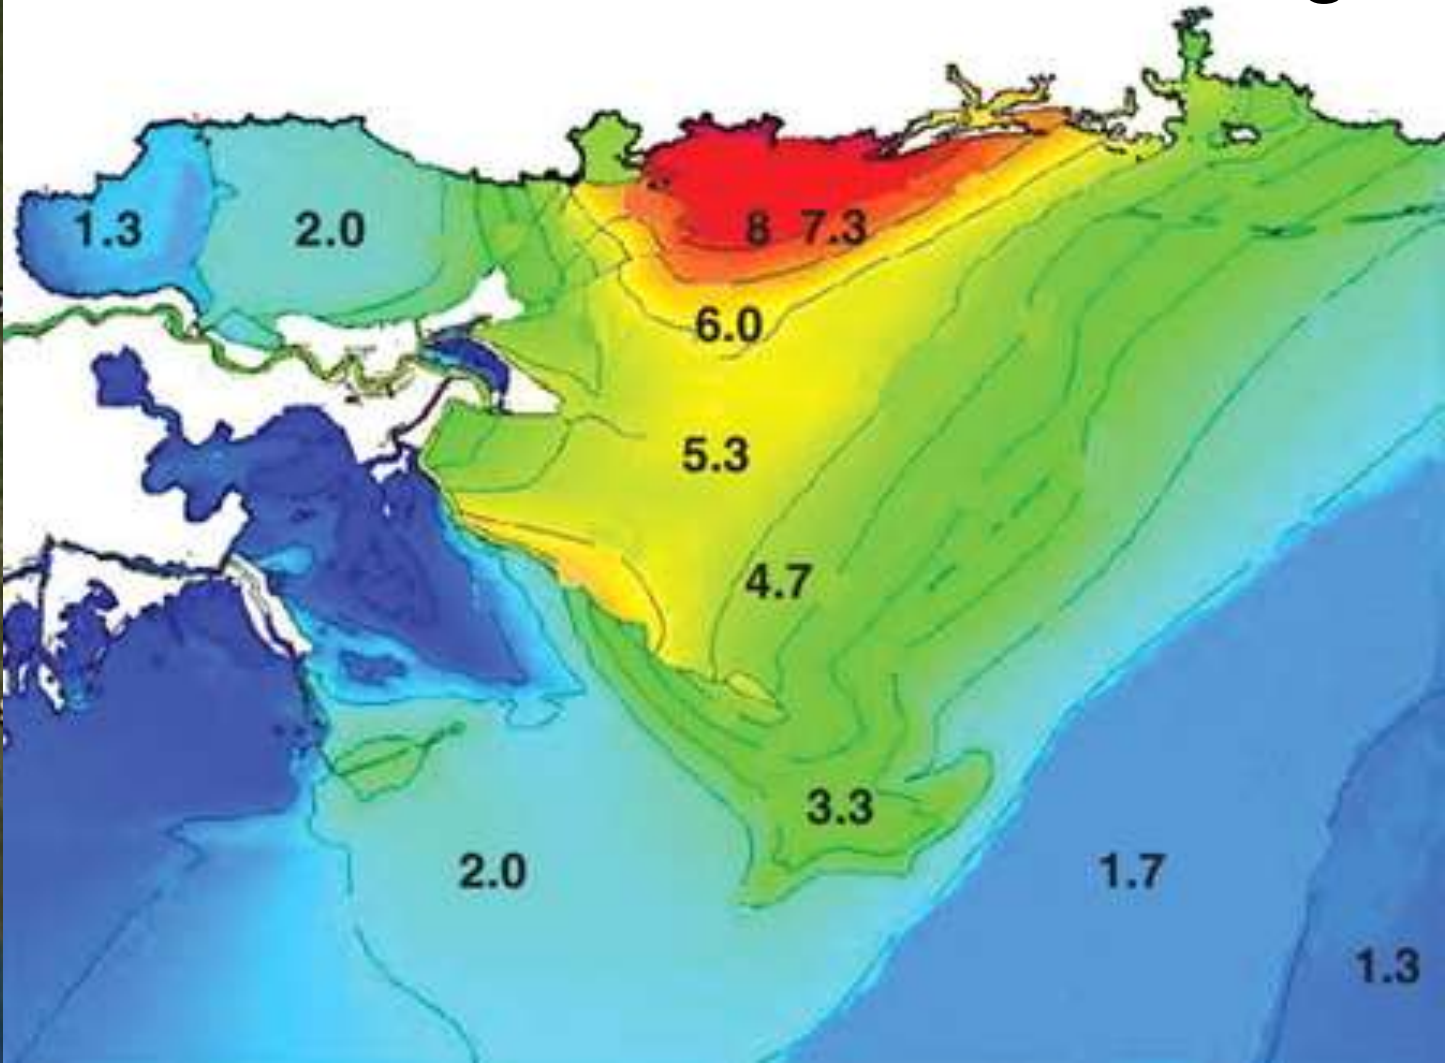

Salt marshes contribute to coastal resilience as storm buffers

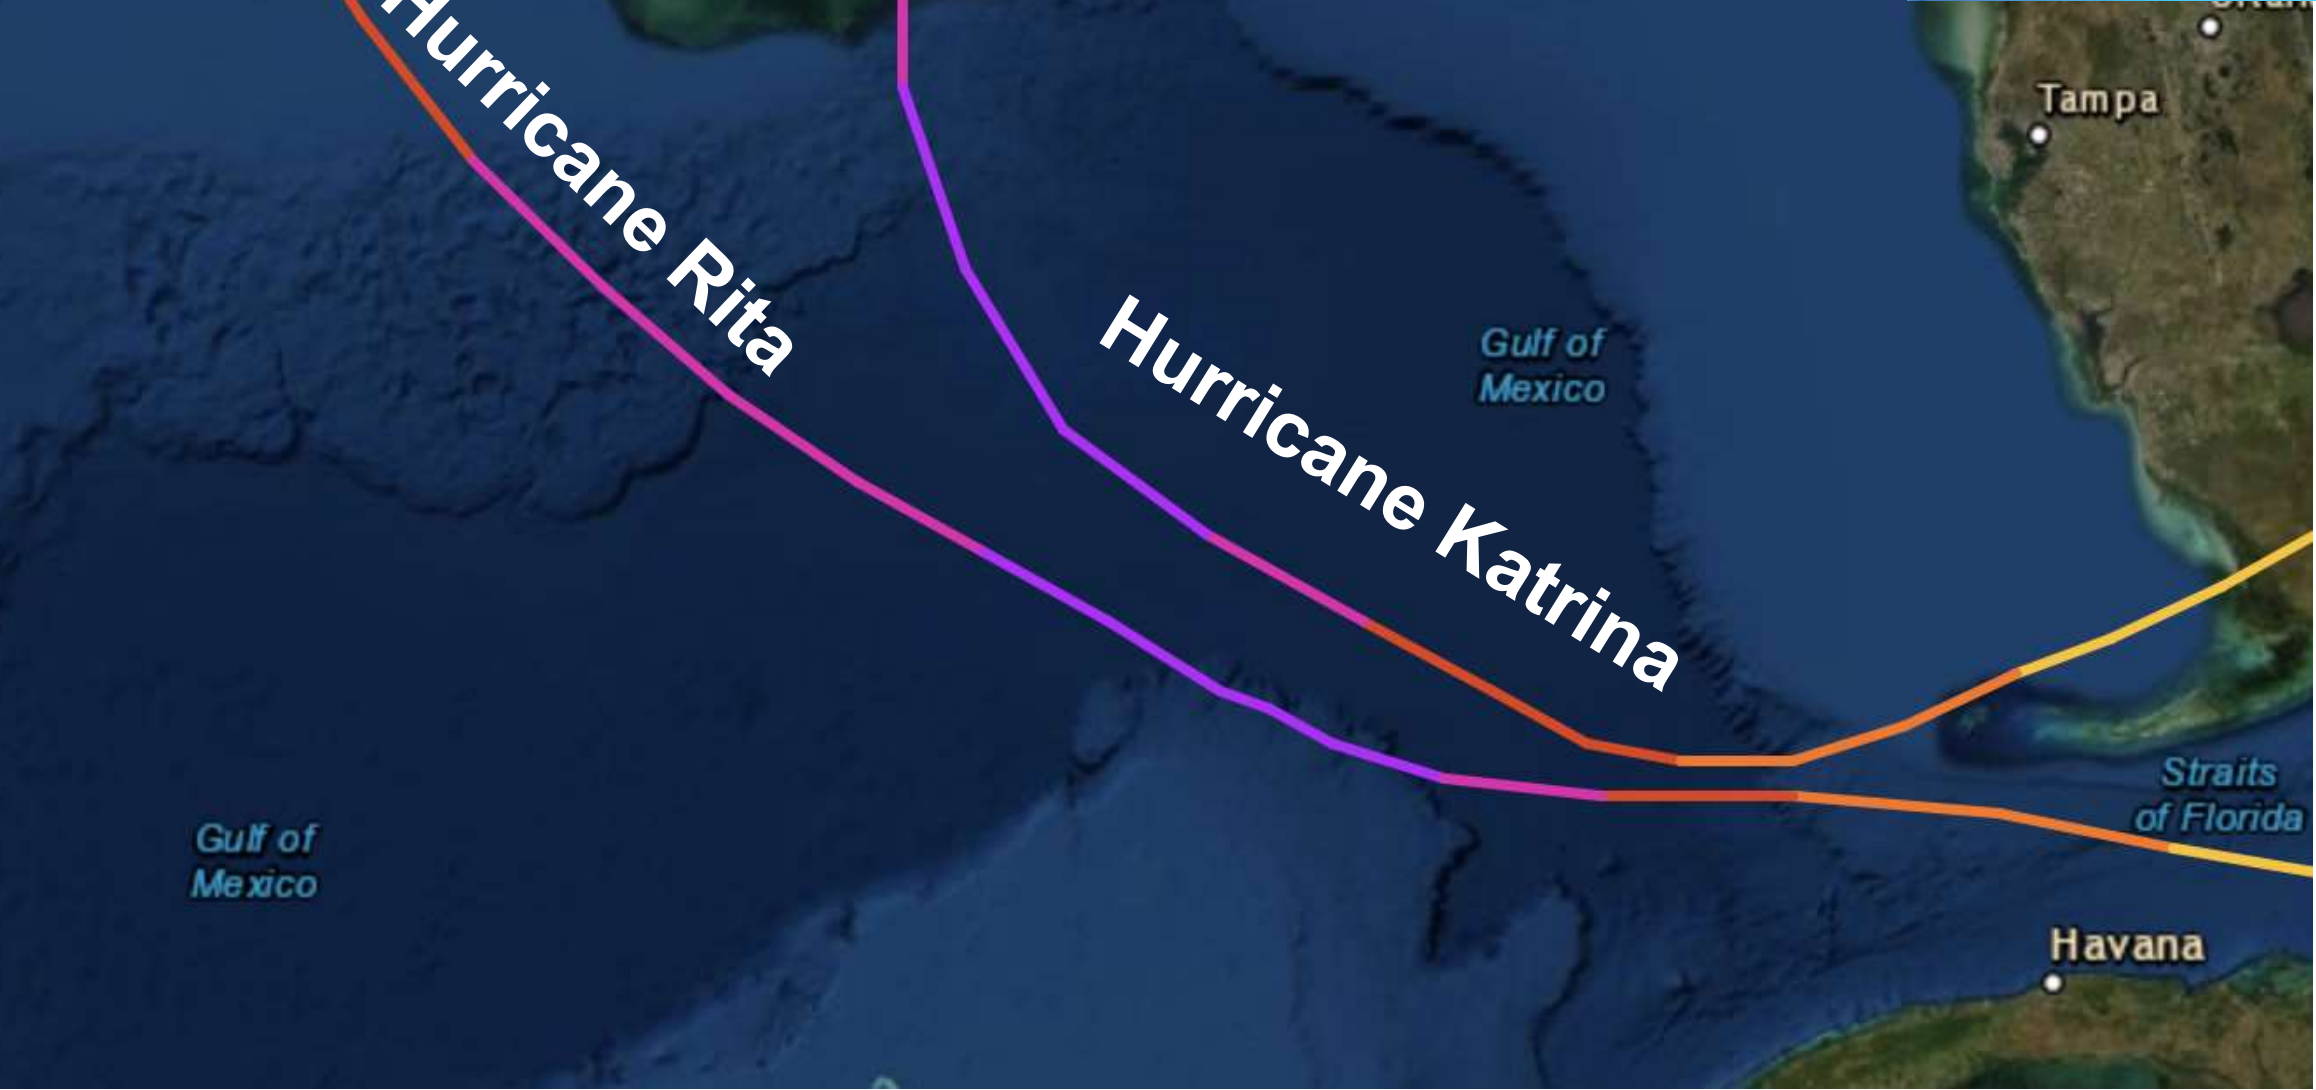

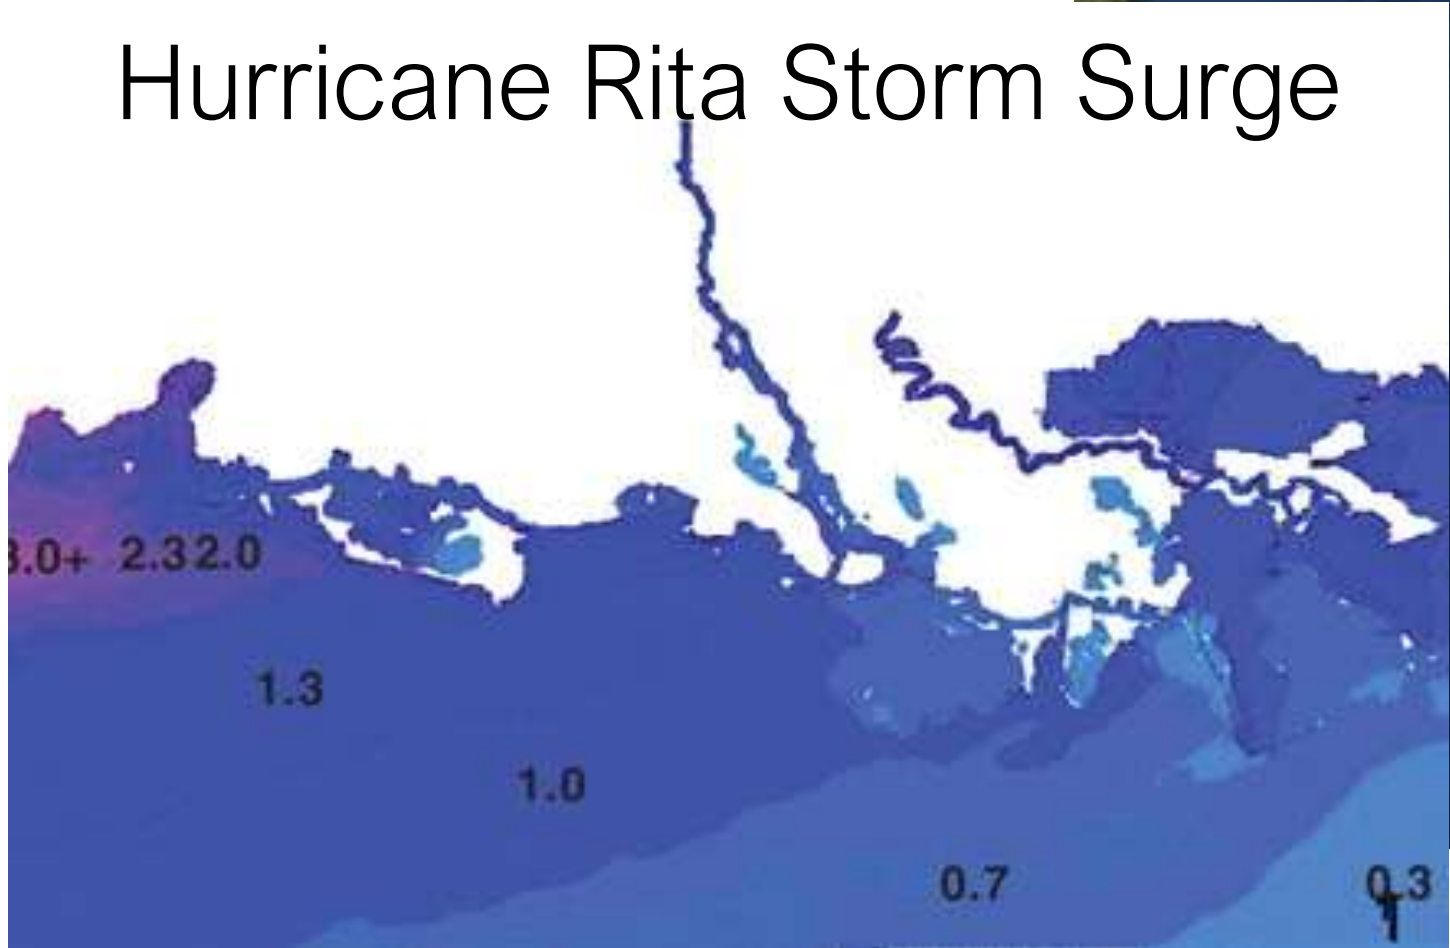

Salt marshes contribute to coastal resilience as storm buffers

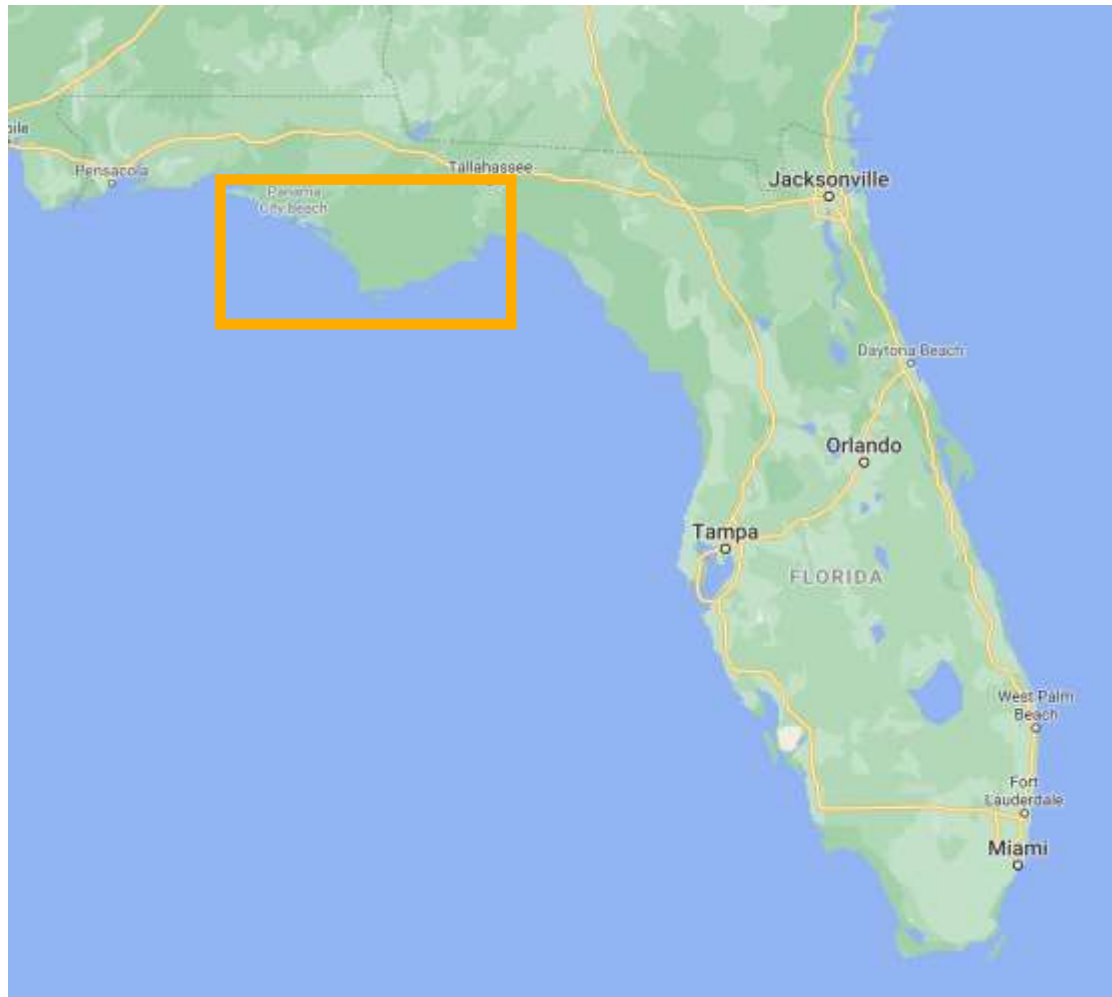

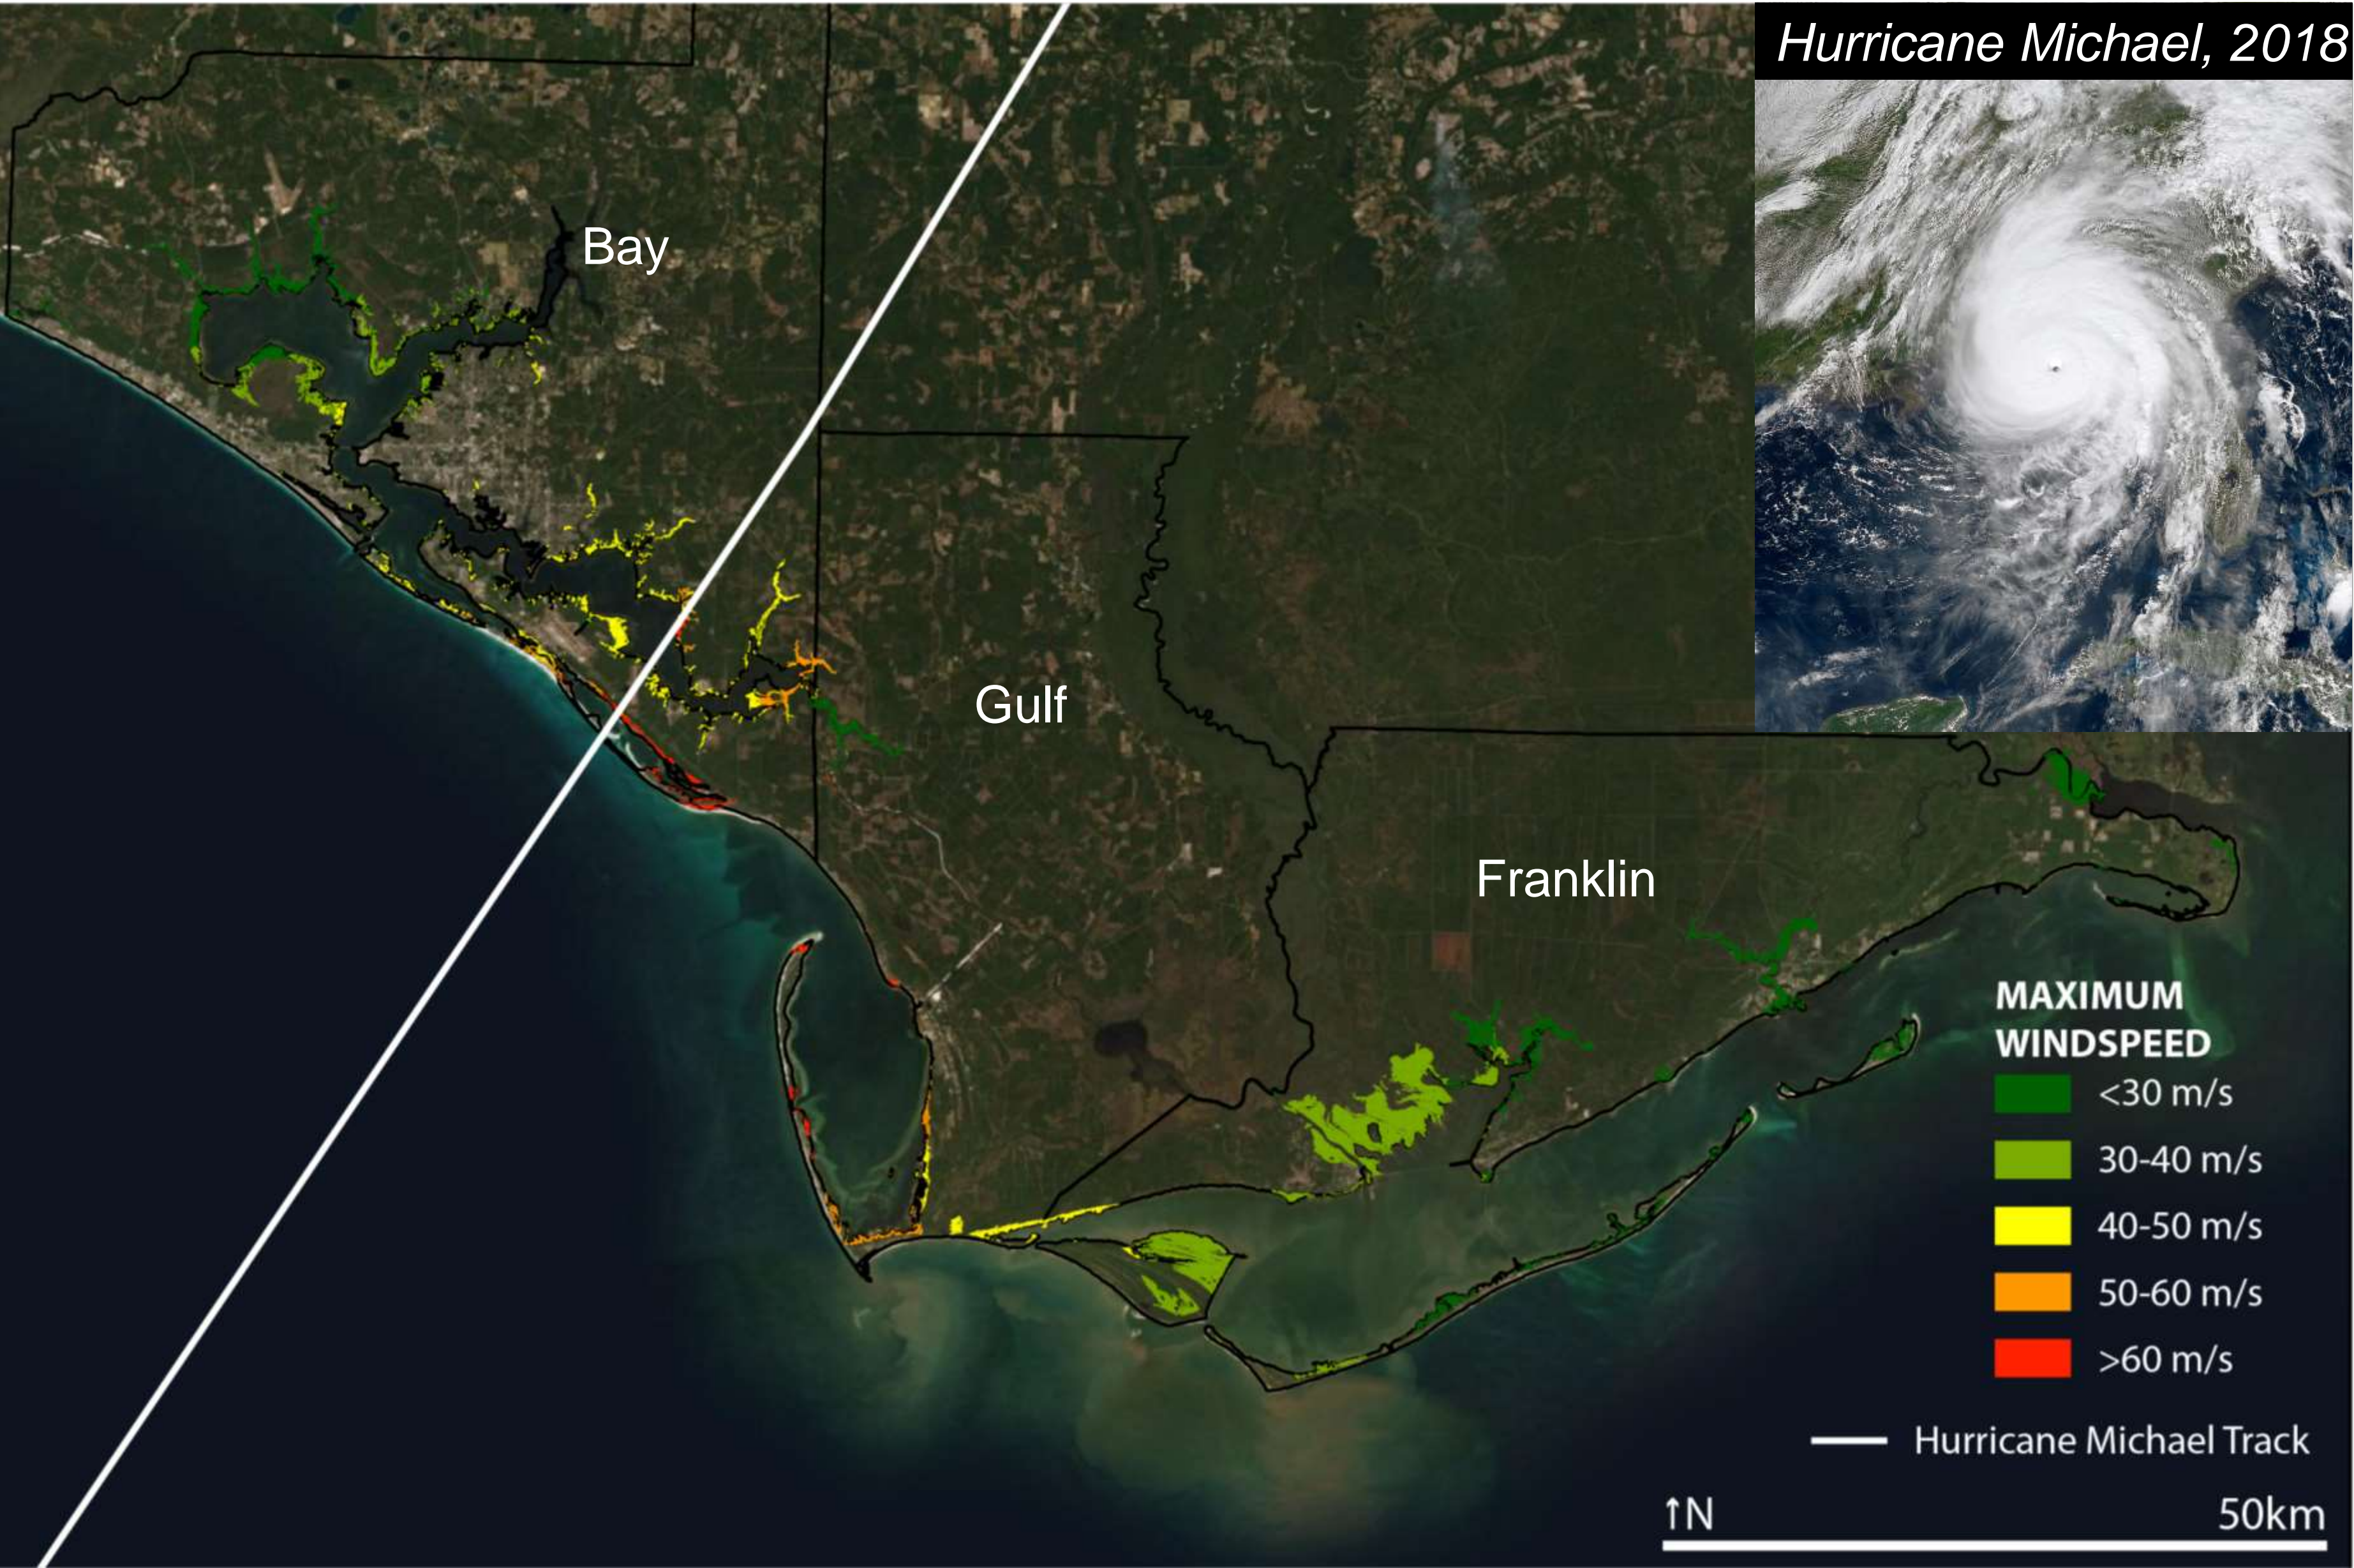

Hurricane Katrina Storm Surge

Hurricane Rita Storm Surge

Salt marshes are largely resistant to storm damage

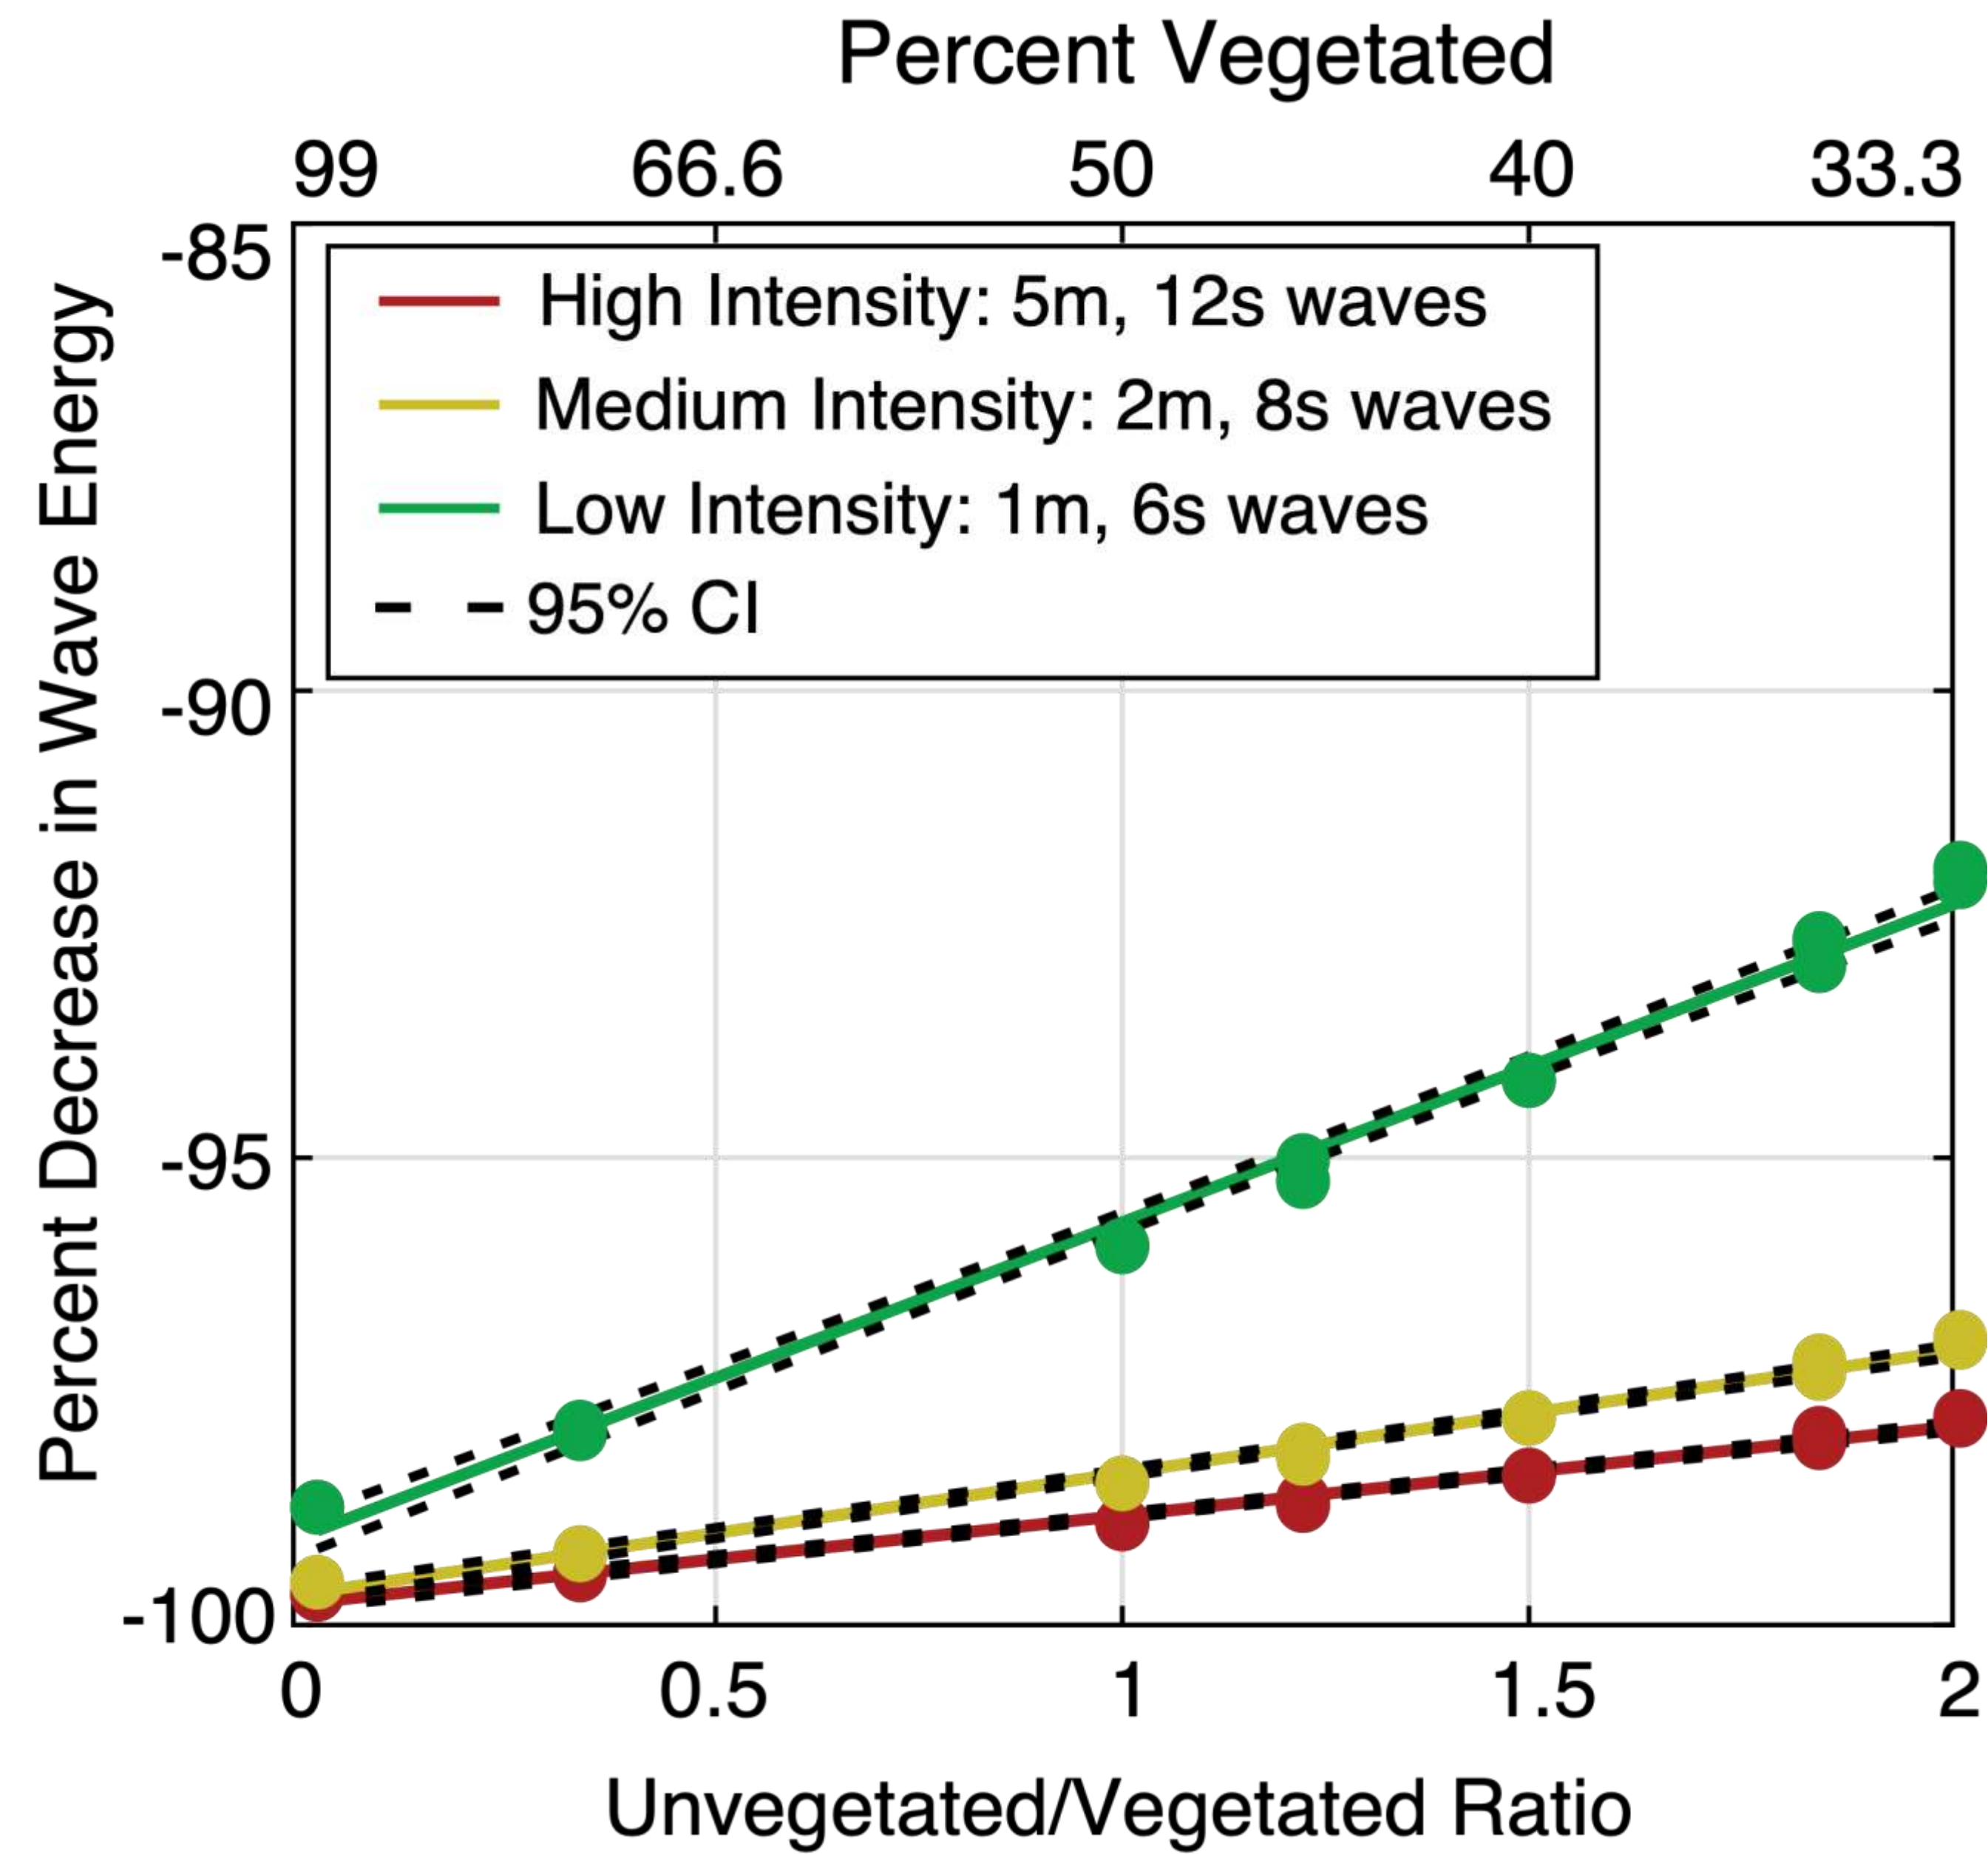

How much restoration is enough to deliver coastal protection?

Modeling to determine restoration benchmarks

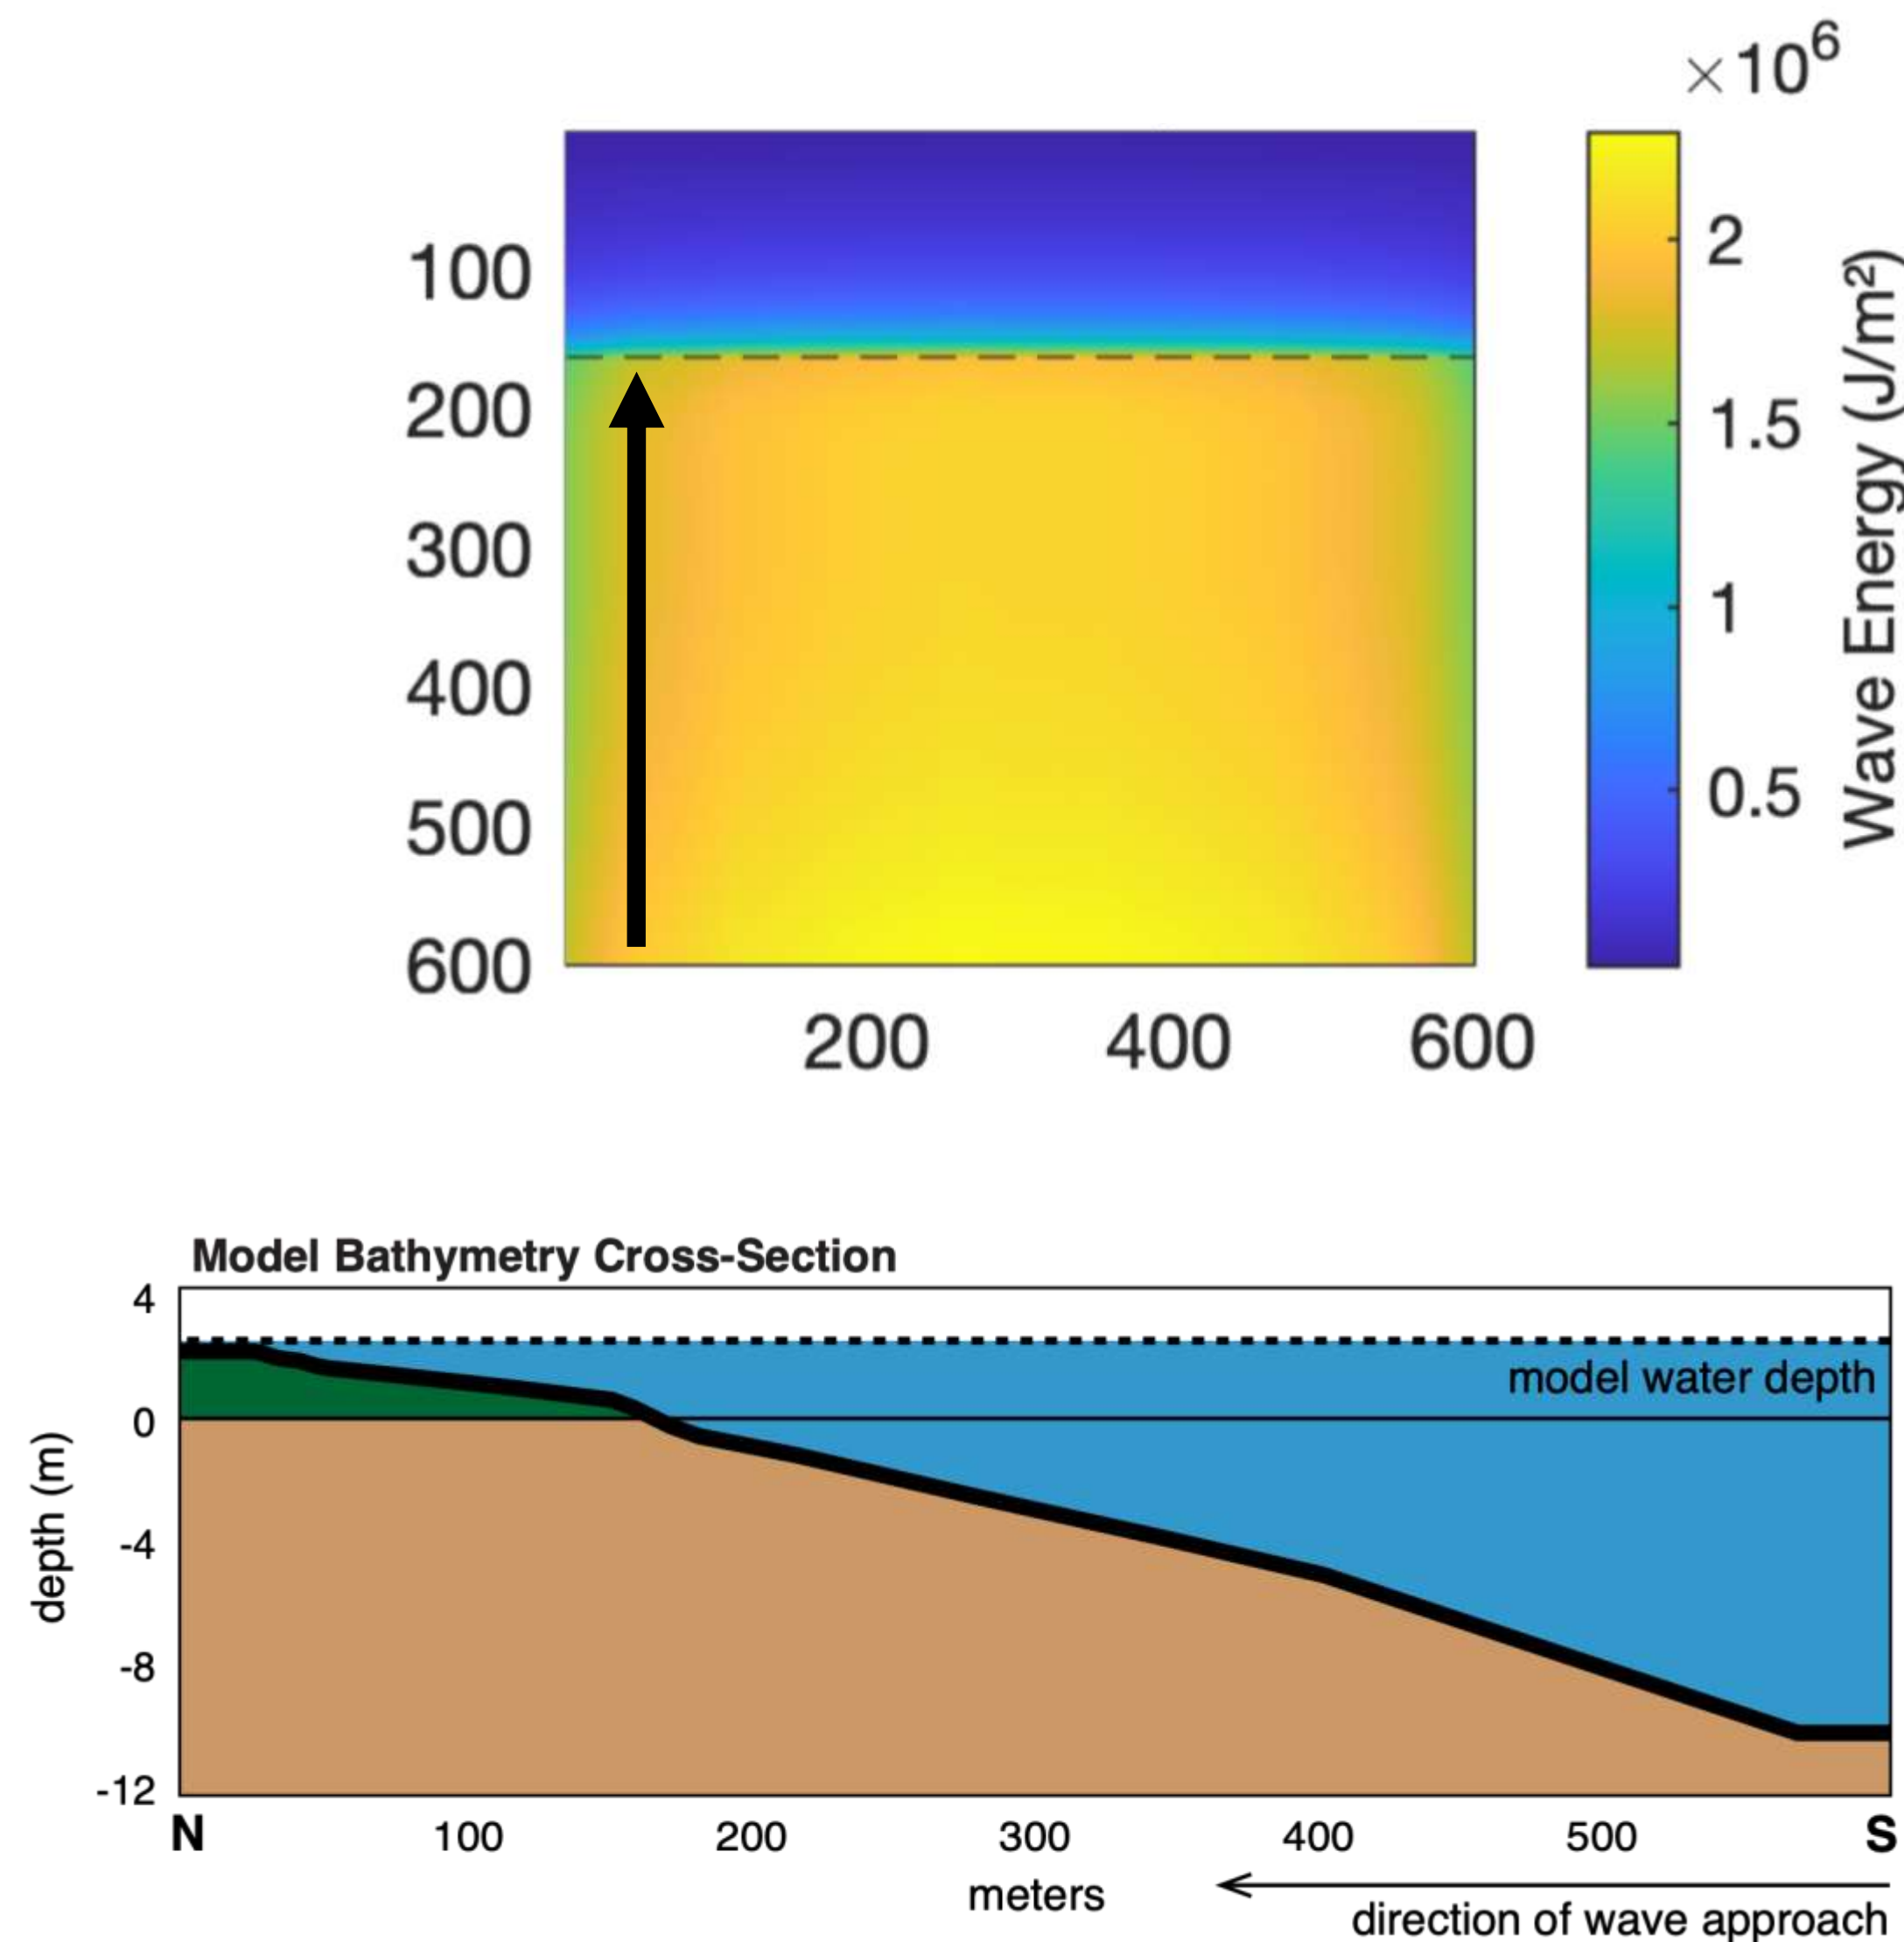

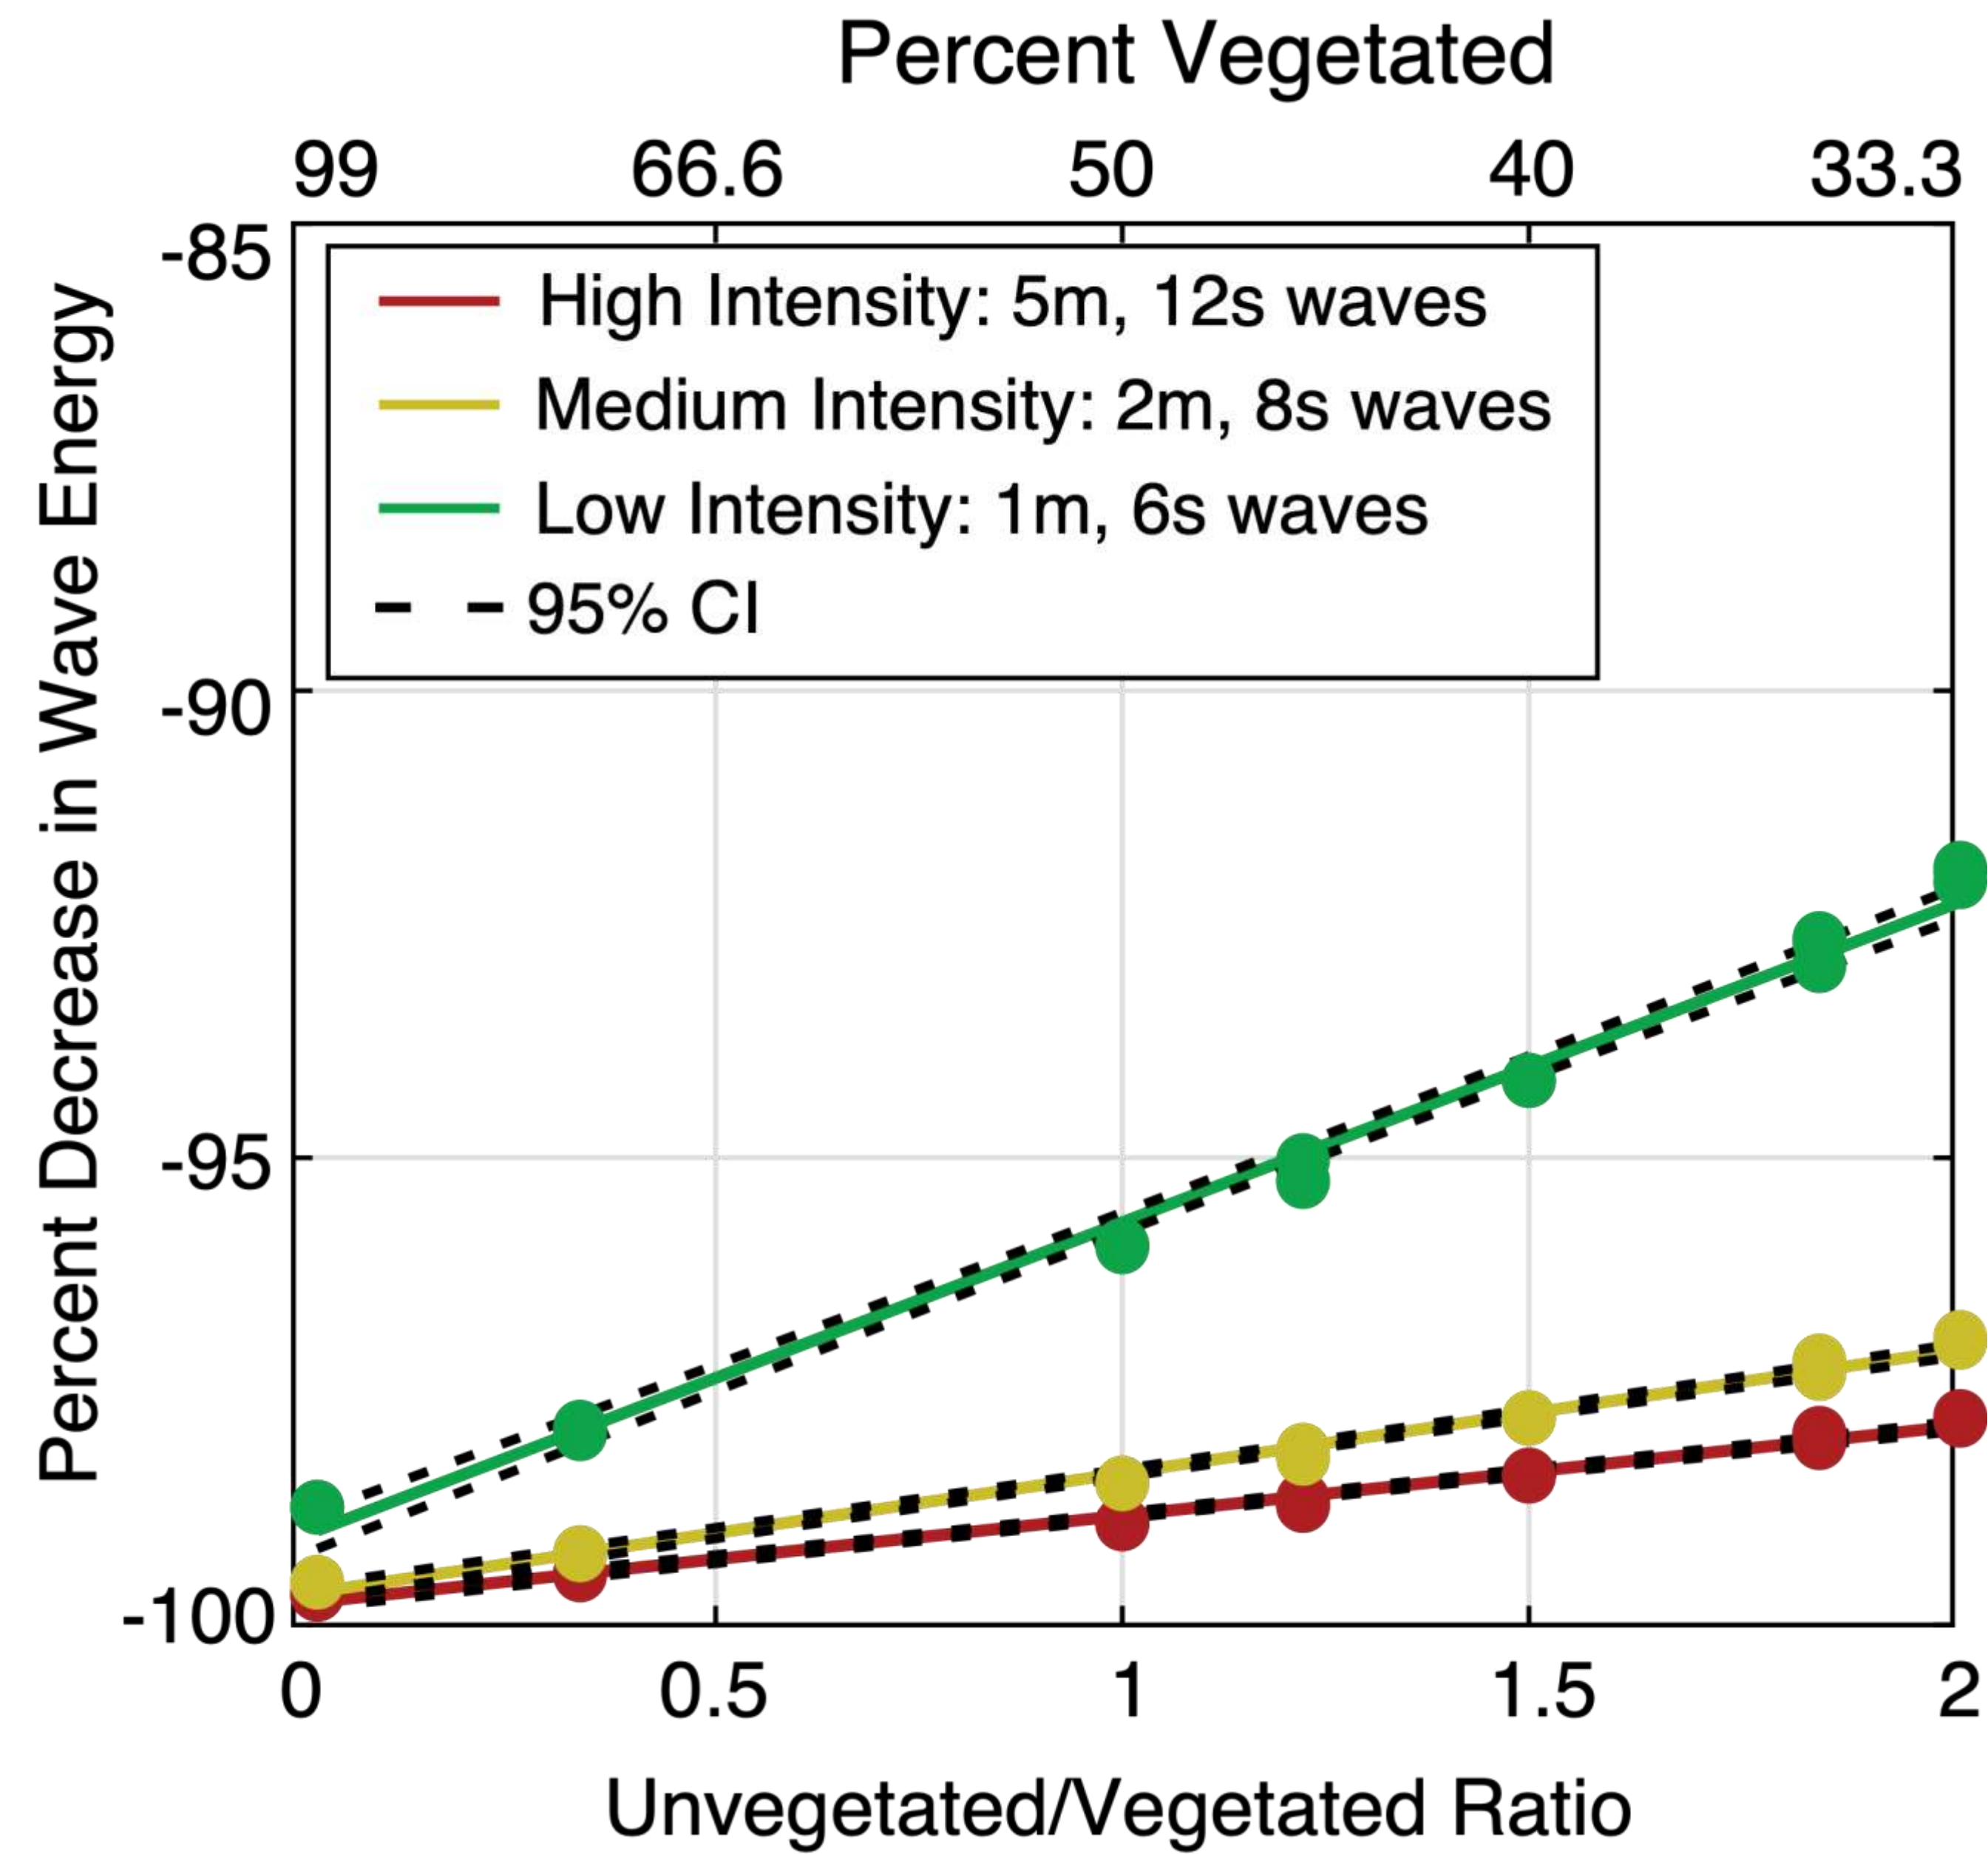

- SWAN (Simulating WAves Nearshore): “a state-of-the-art third-generation wave model which computes random, short-crested wind-generated waves in coastal regions and inland waters” (TU Delft)
- Analysis of percent change in wave energy at 100m from shore (first 40m of marsh reduces wave heights by at least 15%; Möller et al., 2014)

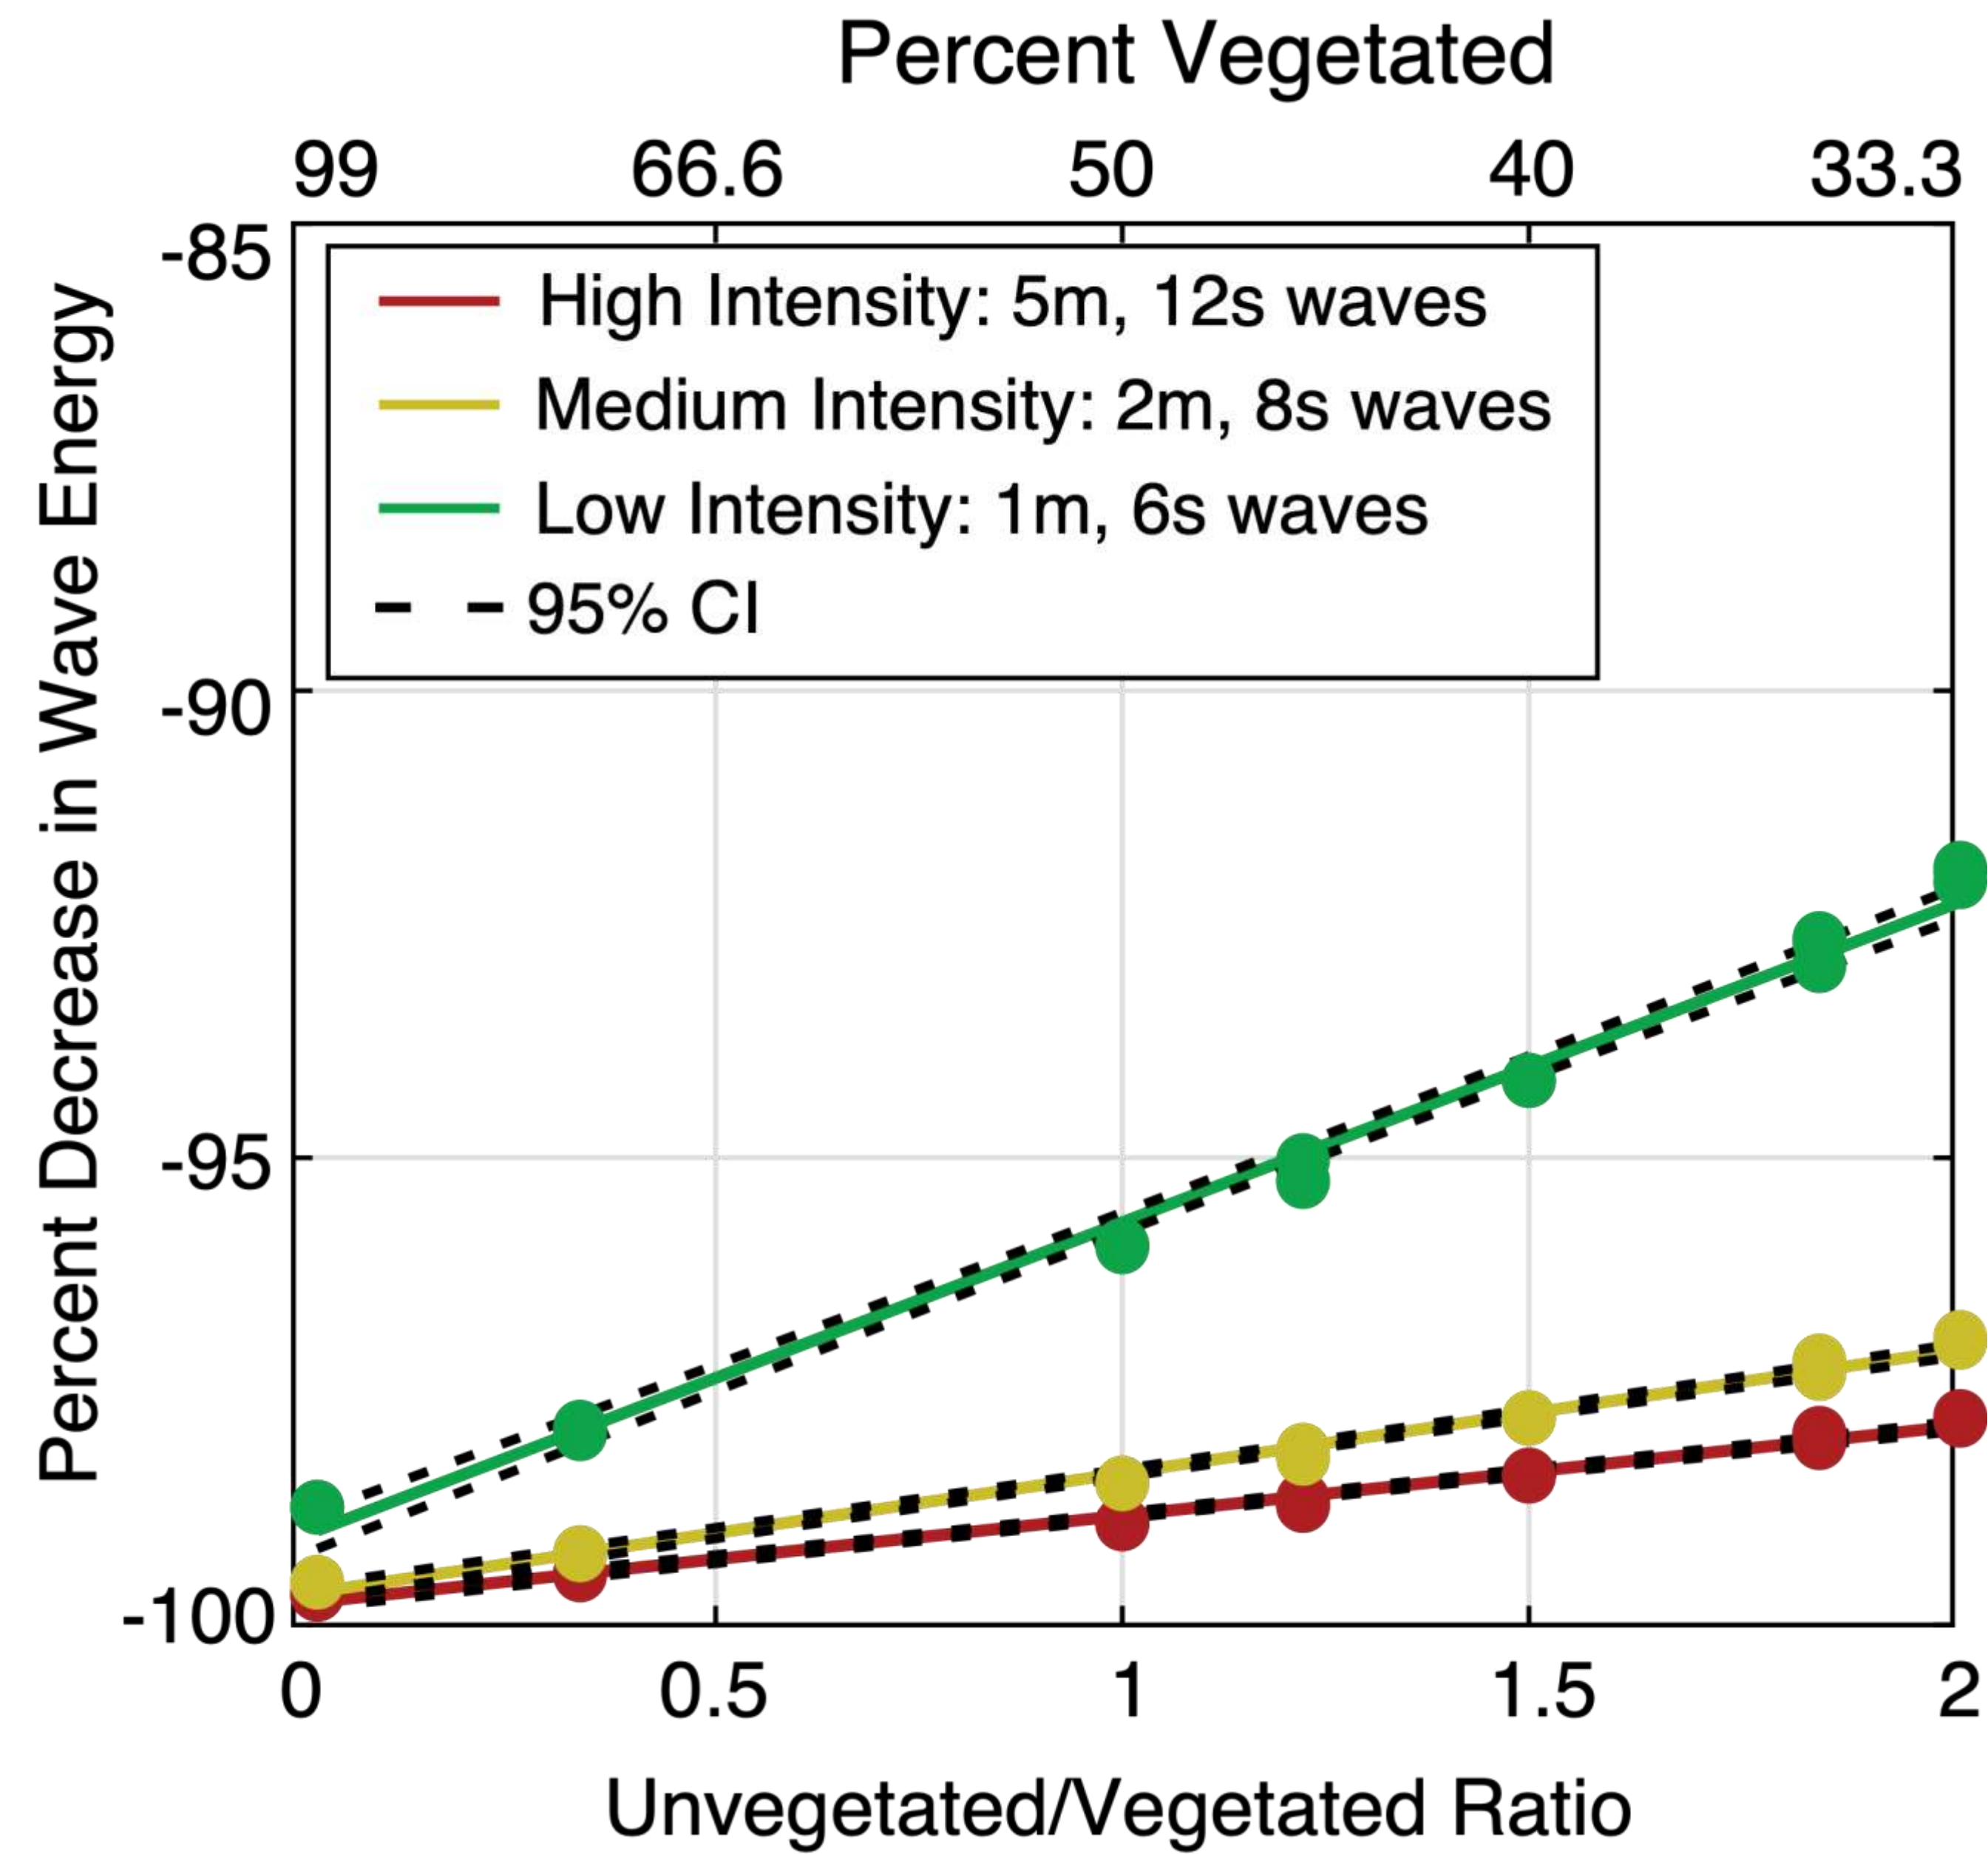

How much restoration is enough to deliver coastal protection?

- **UVVR 1 (50% vegetated)**
 - *Background SLR: 208 years*
 - *0.3 m SLR by 2100: 130 years*
 - *0.5 m SLR by 2100: 120 years*
 - *1.0 m SLR by 2100: 75 years*
- **UVVR 0.1 (90% vegetated)**
 - *Background SLR: 3,477 years*
 - *0.3 m SLR by 2100: 540 years*
 - *0.5 m SLR by 2100: 446 years*
 - *1.0 m SLR by 2100: 200 years*

 - *1.0 m SLR by 2100: 200 years*

How much restoration is enough to deliver coastal protection?

- **Back of the envelope calculation:**

- \$1.25 per 5-cm plug of *Spartina alterniflora*

- 10 plugs/sq. meter

- Moderate SLR (0.5 m by 2100)

- **Planting to 50% cover (UVVR 1):**

- Cost: ~\$614,000

- Lifespan: 120 years

- **Planting to 90% cover (UVVR 0.1):**

- Cost: ~\$1,100,000

- Lifespan: 446 years

- **Would you pay 2x for 4x the lifespan?**

How much restoration is enough to deliver coastal protection?

- **We don't need that much vegetation:**
 - Substantial wave attenuation evident at 30-40% vegetated cover, with significant attenuation (95% reduction in wave energy) by 50% cover
- **We don't need that much marsh (if it is well vegetated):**
 - Up to 95% reduction in wave energy if a leading edge is 40-50m with 80% cover
 - Thinner leading edges (~10-20m) can still provide up to 80% reduction in wave energy
- **Potential to see storm protection ecosystem service benefits at year 0**
- **Must consider lifespan estimates in restoration benchmarks**

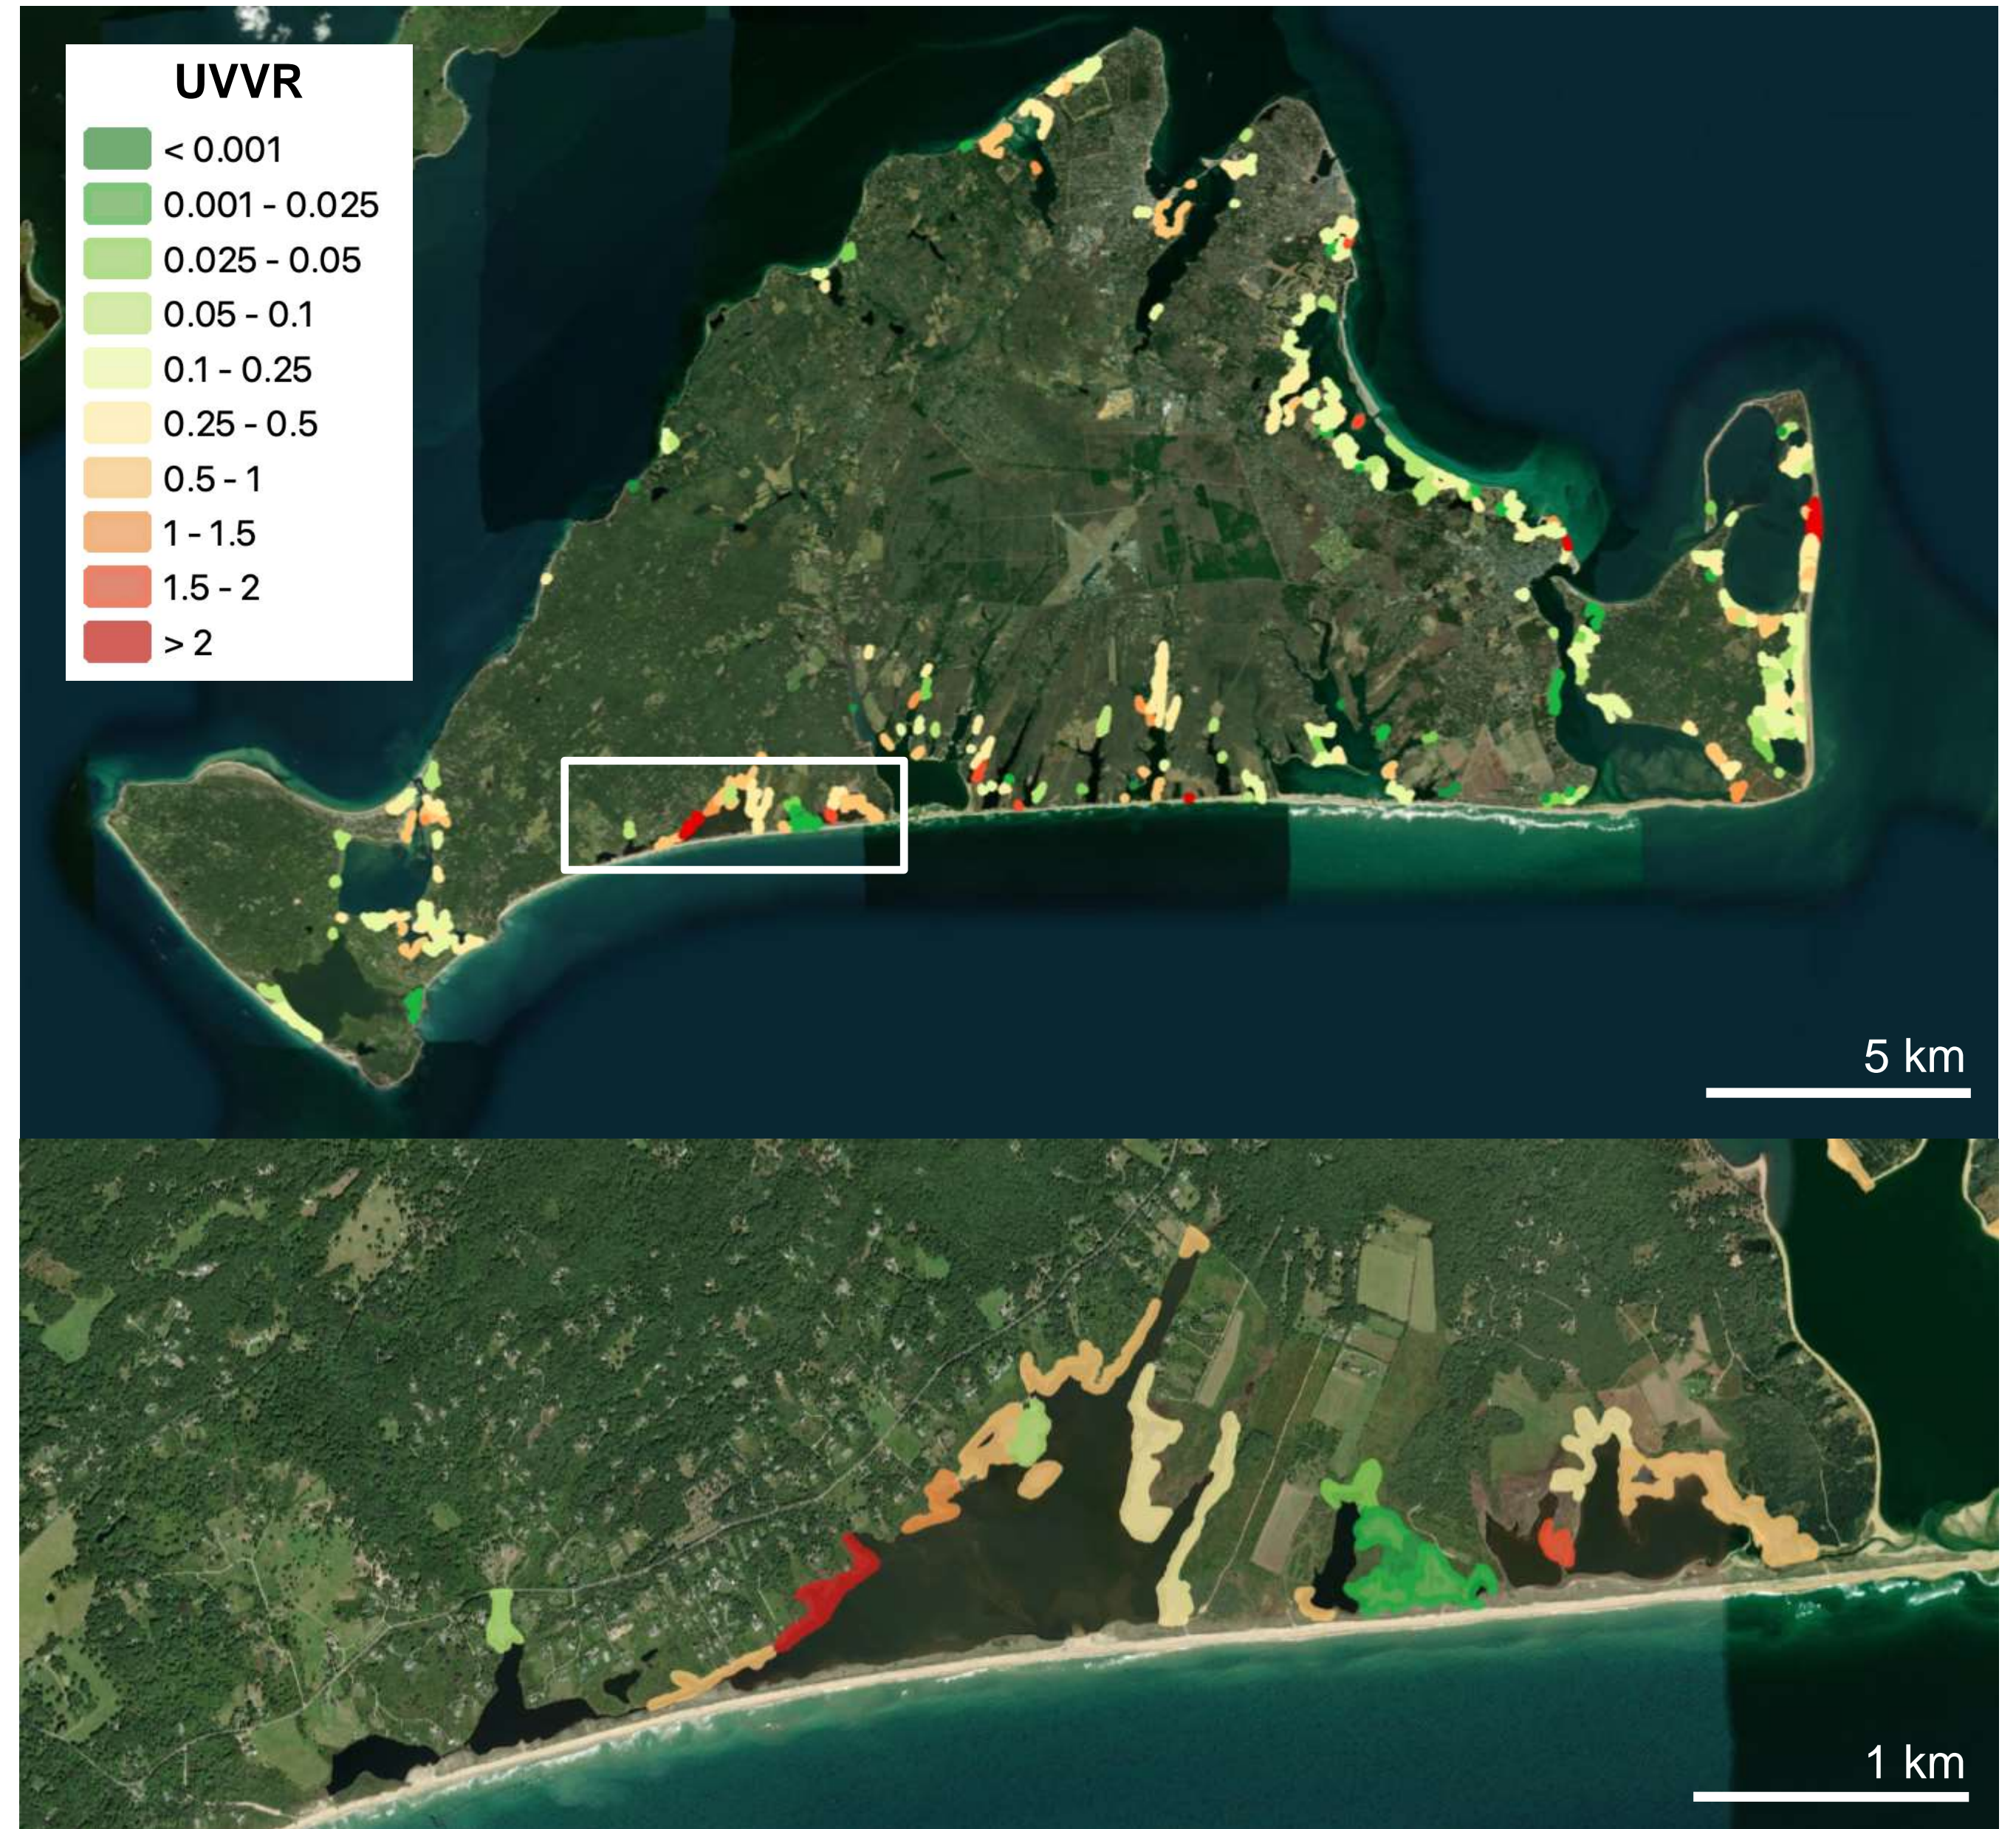

How much restoration is enough to deliver coastal protection?

- Can apply on a wider scale using USGS datasets
 - Connection to unvegetated/vegetated ratio (UVVR)
 - 50% vegetated ~ UVVR 1
- Ecosystem service valuation
- Knowledge sharing with practitioners re: metrics and performance goals (simple linear regressions)

How much restoration is enough to deliver coastal protection?
