### Abstract

Changes in bottom-up forcing are fundamental drivers of fish population dynamics. Recent literature has highlighted the need to incorporate the role of dynamic environmental conditions in stock assessments as a key step towards adaptive fishery management. Combining a bioclimate envelope model and a population dynamic model, we propose a model-based approach that can incorporate ecosystem products into single-species stock assessments. The

# eMOLT Environmental Monitors on Lobster Traps and Large Trawlers

GULF OF MAINE LOBSTER FOUNDATION

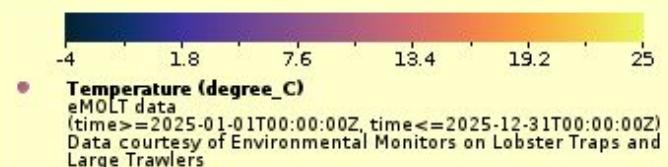

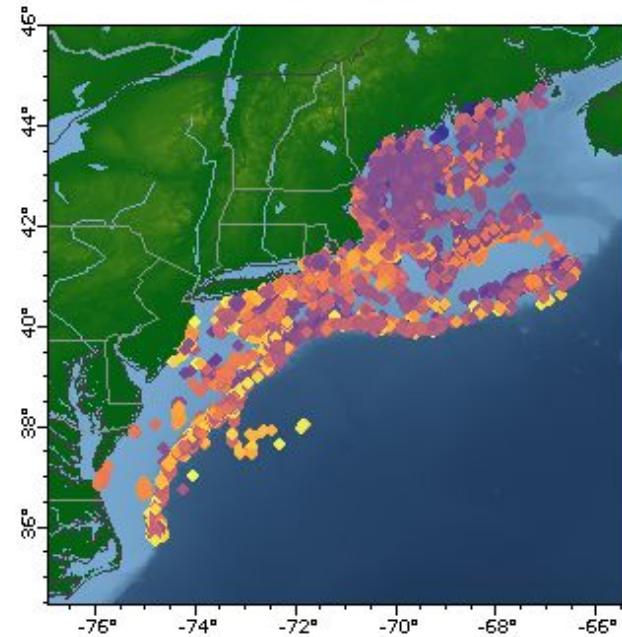

OCEAN  
DATA  
NETWORK

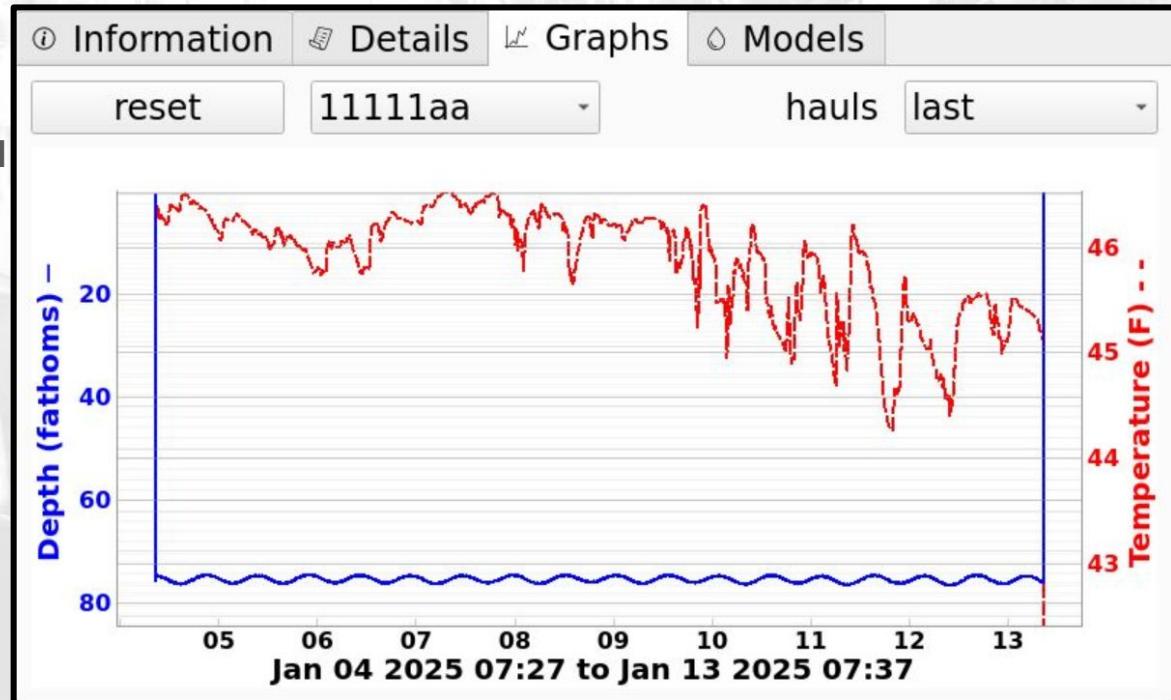

## 2025 eMOLT Data

- 145 vessels contributed data last year
- Home ports from Maine to North Carolina
- Nearly every commercial fishery in the Northeast is represented
  - Lobster
  - Gillnet
  - Longline (tub-trawl, tilefish, pelagic)
  - Fish pots
  - Bottom trawl
  - Scallop dredge
  - Clam dredge
- Nearly 22 million individual data points and 46,000 instrumented tows since 2018

# DATA INTERPRETATION ACTIVITY

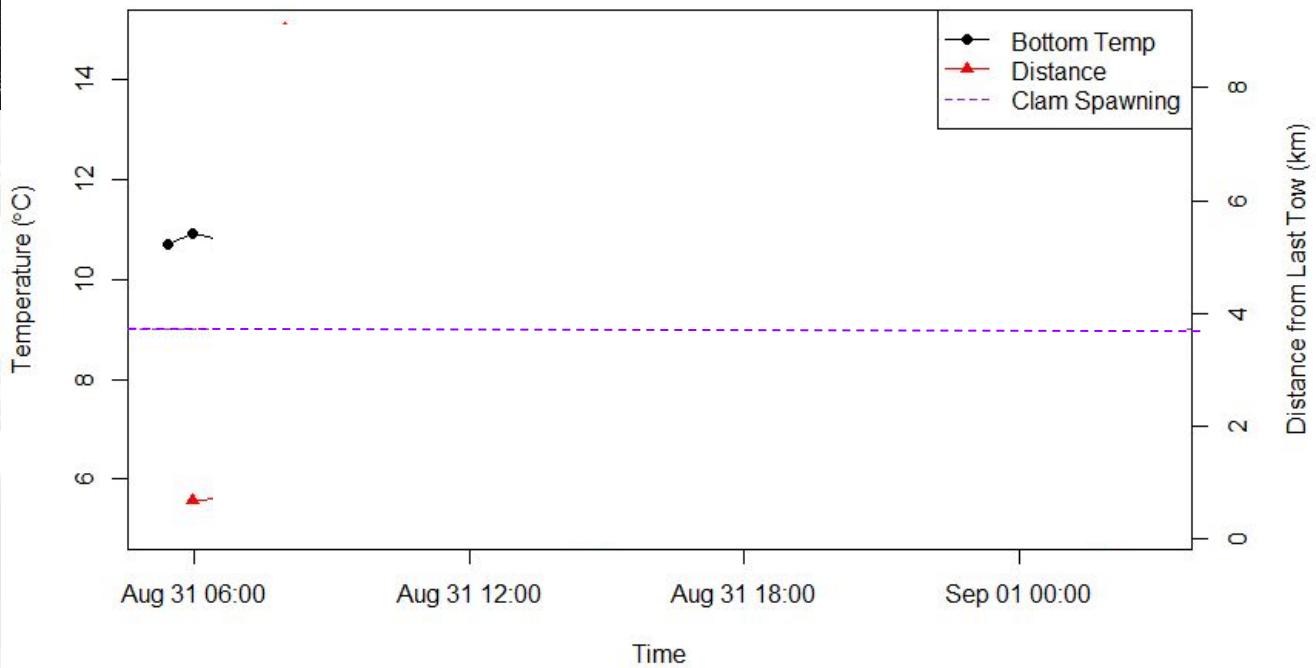

- Break into 6 groups of 4 or 5
- Turn on your DDH
- Review the screens on the DDH to see what the fishermen see after hauling gear.
- Go to “Graphs” and Identify Bottom Temperature and Thermocline
- How do you know if you’re looking at mobile or fixed gear?
- Go to “Models” to see regional predictions

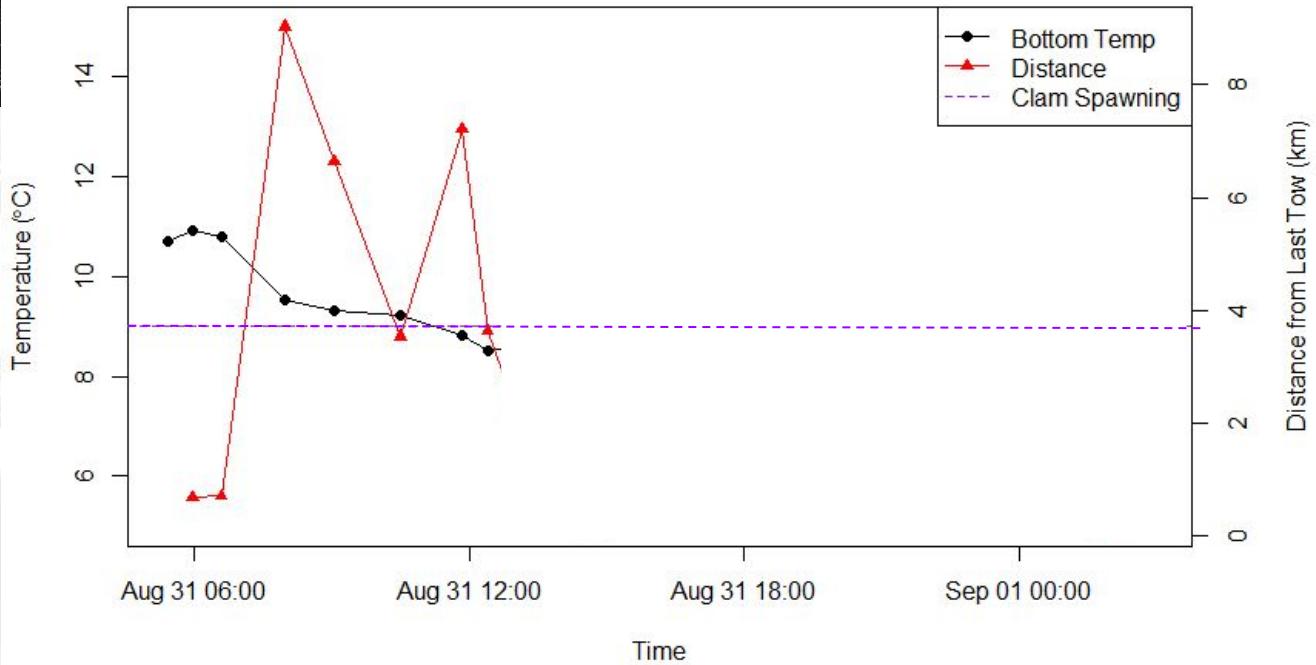

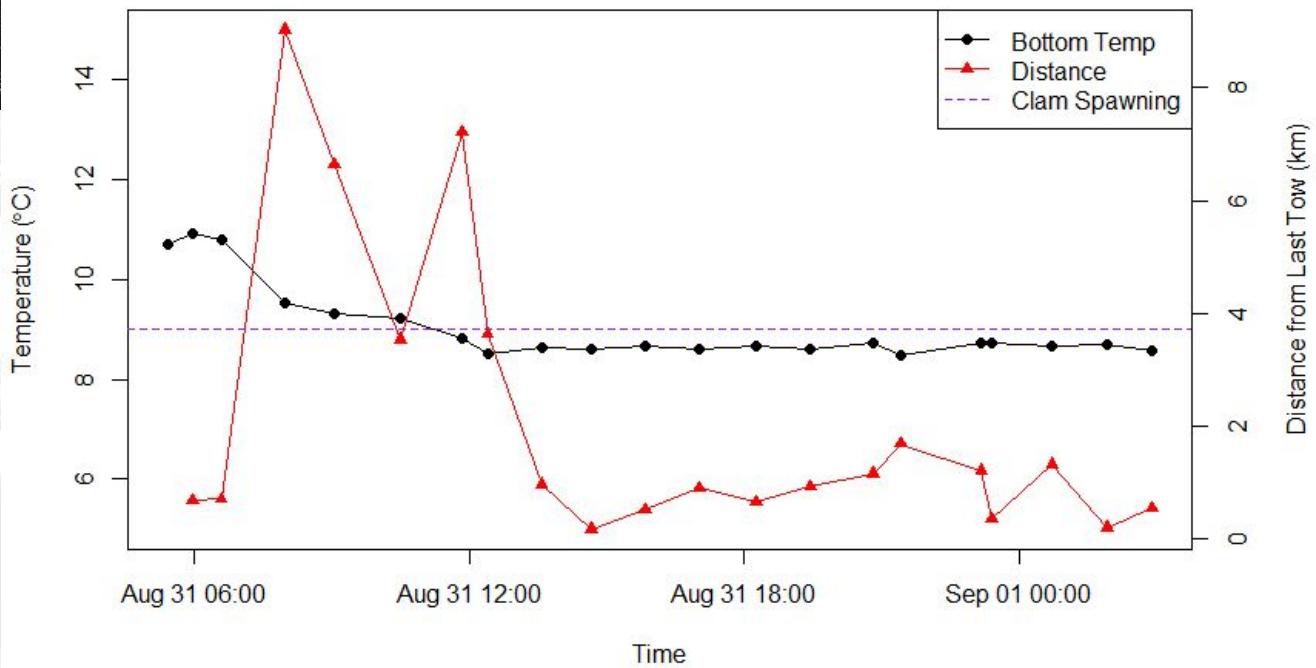

# Do fishermen use the data?

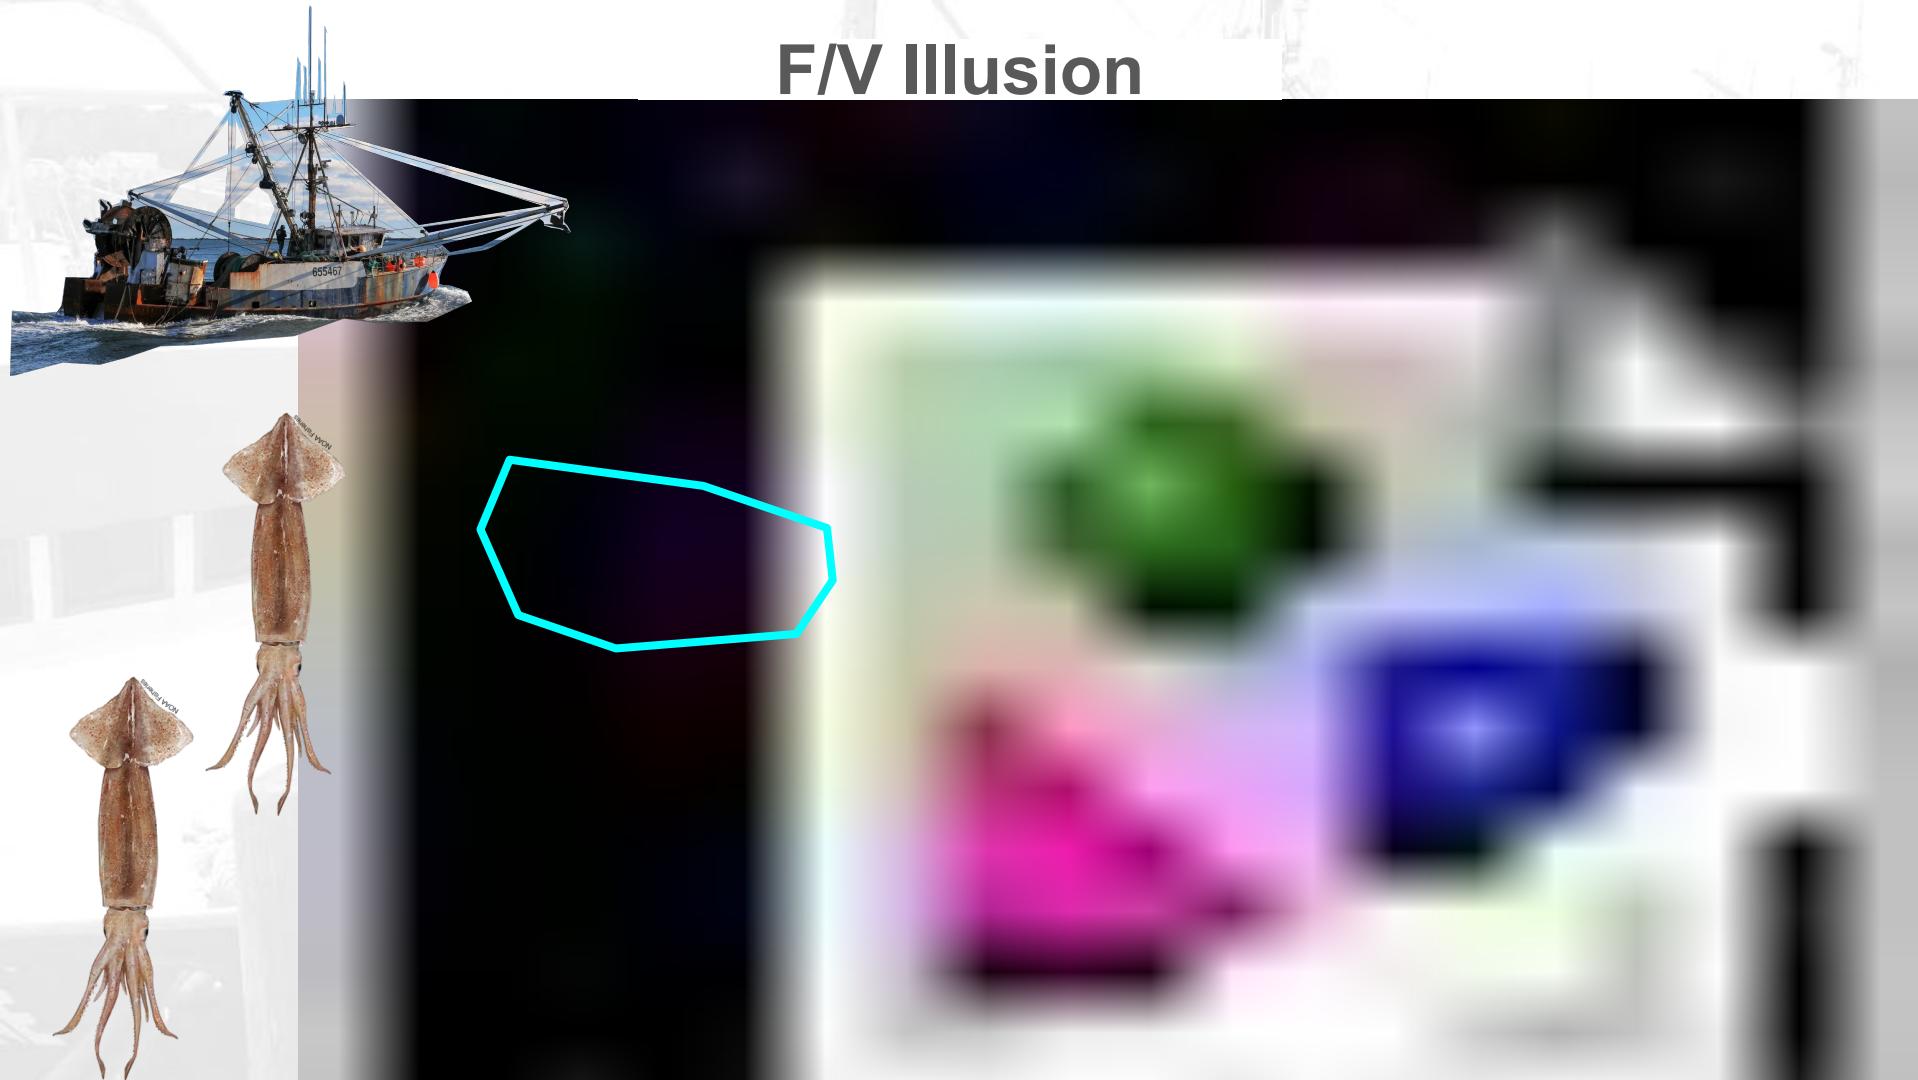

**JiM and Capt. Tony aboard the  
scalloper, F/V Kathryn Marie**

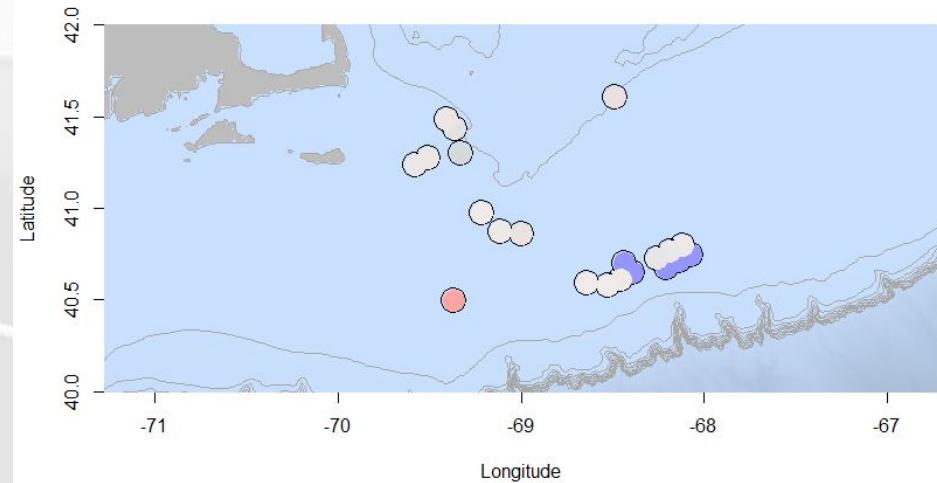

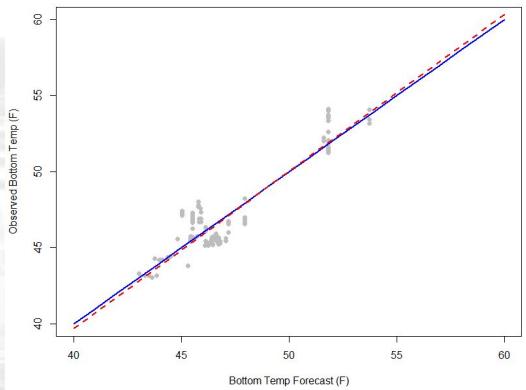

# F/V Illusion

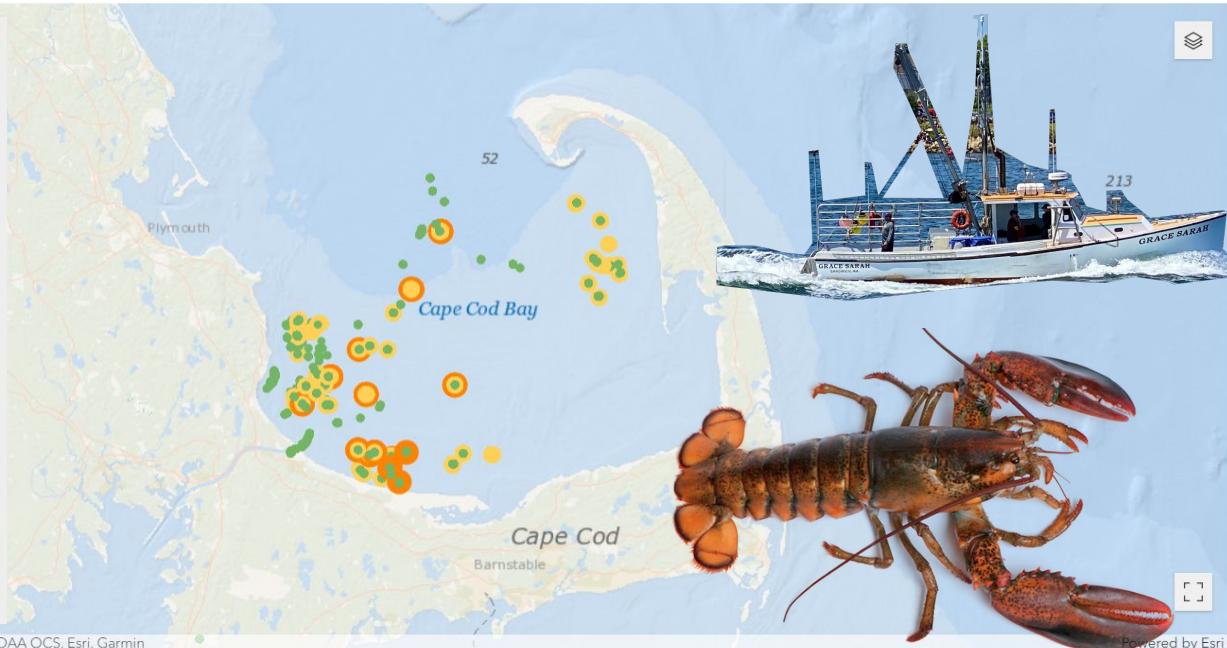

## Dissolved Oxygen Readings from Cape Cod Bay Study Fleet

- F/V Grace Sarah
- F/V Buggin' Out
- F/V Margaret M
- F/V Miss Lilly
- F/V Mussel Point
- F/V Raider III
- F/V Resolve
- F/V Trap Queen
